

CONTENTS

Chapter 1 Introduction	1
Recent developments in compact exchanger technology	1
Basic aspects of compactness	3
Scaling laws for heat exchangers	9
The relationship of compactness and enhancement	14
The function of secondary surfaces (fins)	19
Compactness and its relationship to enhanced boiling surfaces, rib roughnesses, etc.	20
Surface optimisation	22
Heat exchanger reactors	23
References	25
Chapter 2 Industrial Compact Exchangers	27
The Plate-Fin Heat Exchangers (PFHE)	28
The Brazed Aluminium PFHE	28
Dip brazed and solder-bonded exchangers	31
The brazed stainless steel/ titanium heat exchanger	32
Tube-fin heat exchangers	34
Diffusion bonded heat exchangers	35
The printed circuit heat exchanger (PCHE)	35
Welded plate heat exchangers	41
Plate and Frame Heat Exchangers (PHE) and derivatives	51
Plate and Frame Heat Exchangers (PHE)	52
Brazed Plate Heat Exchangers	57
Welded Plate Heat Exchanger (PHE types)	58
Other specialised PHE types	59
The Plate and Shell Heat Exchanger (PSHE)	60
Spiral Heat Exchangers (SHE)	61
Compact Shell and Tube Heat Exchangers	63
Polymer Exchangers	64

Some recent developments	65
Polymer exchanger development	65
Gas turbine recuperator developments	66
Heat Exchanger Reactors	69
Heat exchangers with reactant injection	69
Catalytic reactor exchangers	71
Surface selection	74
Process exchangers	74
Refrigeration exchangers	79
Automotive and prime mover sector	79
Aerospace sector	79
References	80

**Chapter 3 The Heat Exchanger as Part of a System:
Exergetic (Second Law) Analysis** 83

Introduction	83
Basic Principles of Exergy Analysis	84
First and Second Law (Open Systems)	84
Availability, exergy, lost work	86
Exergy	88
Steady flow exergy processes	90
Application of Exergy Analysis to Heat Exchangers	92
Basics of entropy generation	93
Zero Pressure Drop	96
Balanced counterflow	96
General analysis for exchangers with flow imbalance	101
Unbalanced counterflow	104
Cocurrent (parallel) flow	105
Condensing on one side	106
Evaporation on one side	107
Finite Pressure Drop	107
Optimisation based on local rate equation	107
Application of the rate equation to balanced counterflow	112
Implications of the Entropy Minimisation Analysis for Selection and Design	116
Application To Heat Exchanger Networks	120
References	121

Chapter 4 Surface Comparisons, Size, Shape and Weight Relationships	125
Introduction	125
Conventional Theory (The Core Mass Velocity Equation, and Geometrical Consequences)	126
Heat transfer	126
Pressure drop	128
Combined thermal and pressure drop comparison	128
Operating parameter	131
Size and shape relationships	133
Exchanger (side) weight	136
Pumping power	136
Laminar Flow Analysis	137
Heat transfer	137
Pressure drop	138
Combined heat transfer and pressure drop	139
Size and shape relationships	140
Pumping power	142
Comparison of Compact Surfaces	143
Comparison of Conventional and Laminar Approaches	146
References	153
Chapter 5 Surface Types and Correlations	155
Introduction	155
Ducts	155
Laminar flow	156
Fully developed laminar flow	156
Developing laminar flow (entrance region effects)	161
Turbulent and transitional flow in ducts	170
Plate- Fin Surfaces	174
Plain fin (Rectangular triangular and sine section shapes)	176
Offset Strip fin, OSF	178
Wavy (corrugated or herringbone) fin	179
Perforated fin	184
Louvred fin surfaces	184
Pressed Plate Type Surfaces	193
Plate and Shell Surfaces	196
Other Plate-Type Surfaces (Welded Plates etc.)	196

Printed Circuit Heat Exchanger (PCHE) Surfaces	197
References	197
Chapter 6 Thermal Design	201
Introduction	201
Form of specification	202
Basic Concepts and Initial Size Assessment	203
The effectiveness method	203
Inverse relationships	209
The LMTD method	210
The LMTD design method	210
Overall conductance	214
Wall temperature	217
The core mass velocity equation	218
Face area, volume and aspect ratio	219
Details of the Design Process	221
The effect of temperature- dependent fluid properties	221
Fin efficiency and surface effectiveness	222
Layer stacking and banking factor	225
Entry and exit losses	226
Thermal-hydraulic design of headers and distributors	229
The effect of longitudinal conduction	235
The effect of non- uniformity of manufacture of heat exchanger passages	243
Design for Two- Phase Flows	243
Boiling	247
Condensation	254
Two-phase pressure drop	255
The design process	257
Stage 1: Scoping size	258
Stage 2.	259
A. Counterflow design.	259
B. Crossflow design	260
C. Multipass crossflow, overall counterflow configuration.	260
D) Design process for two- phase flows	261
Final block sizes (all configurations)	262

Thermal Design for Heat Exchanger Reactors	264
Mechanical Aspects of Design	266
Pressure containment	266
Strength of bonds	268
References	268
Chapter 7 Compact Heat Exchangers In Practice	275
Installation	275
Commissioning	277
Operation	278
Maintenance	279
Maintenance – General Factors	279
Maintenance - Fouling and Corrosion	280
Crystallisation or precipitation fouling	281
Particulate fouling (silting)	284
Biological fouling	286
Corrosion fouling	287
Chemical reaction fouling	288
Freezing or solidification fouling	288
Heat Exchangers Designed to Handle Fouling	289
Applications of Compact Heat Exchangers and Fouling Possibilities	290
Design Approaches to Reduce Fouling	293
Principles of exchanger- pumping system interaction	293
The effect of fouling and the heat exchanger surface on thermal performance	295
Fouling Factors	296
References	300
Appendices	303
1. Nomenclature	304
2. Conversion factors	309
3. Software organisations and awareness groups	311
4. List of manufacturers	331
5. Physical properties	340
5.1 Properties of gases	342
5.2 Properties of saturated liquids	349

5.3	Thermophysical properties of refrigerants	372
5.4	Properties of fuels and oils	375
5.5	Thermophysical properties of metals	377
5.6	Thermophysical properties of nonmetallic solids	381
5.7	Mechanical properties of ferrous alloys	383
5.8	Mechanical properties of non-ferrous alloys	384
5.9	Mechanical properties of ceramic materials	385
5.10	Mechanical properties of polymers	386
	Sources and acknowledgements of property data	388
