1. Introduction

1.1 Scopus – an overview

Scopus launched in November 2004. It is the largest abstract and citation database of peer-reviewed literature, featuring smart tools to track, analyze and visualize research. With over 21,500 titles from more than 5,000 international publishers, Scopus delivers the most comprehensive overview of the world’s research output in the fields of science, technology, medicine, social science and arts and humanities.

Publishers indexed in Scopus

Scopus at a glance, updated January 2016:

- Over 21,500 titles (see section 4.1):
  - Over 21,500 peer-reviewed journals (including 4,200 full open access journals)
  - 360 trade publications
  - Over 530 book series
  - Over 7.2 million conference papers from over 83,000 worldwide events
  - “Articles-in-Press” from over 5,000 journals (see section 5)
  - More than 116,000 books with 120,000 expected by early 2016 and 10,000 added each year thereafter

- Over 60 million records (see section 3.1):
  - 38+ million records with references back to 1996 of which 84% include references
  - 22+ million records pre-1996 which go back as far as 1823

- Patents:
  - More than 27 million patent records from five patent offices (see section 2.3)

For additional information and updates, please refer to: http://www.elsevier.com/solutions/scopus/content and follow the Scopus blog: http://blog.scopus.com/.

elsevier.com/scopus
Scopus content growth

![Scopus content growth chart]

Scopus supports researchers and librarians in three key areas:

**Search**
- Search by document, author or affiliation, or use Advanced Search
- Refine results by source type, year, language, author, affiliation and more
- Link to full-text articles and other library resources
- Use the QUOSA Document Download Manager to bulk retrieve results in PDF format
- Export data to Reference Managers such as Mendeley, RefWorks and EndNote
- Stay up to date with email alerts, RSS and HTML feeds

**Discover**
- Find related documents by shared references, authors and/or keywords
- Identify and match an organization with its research output using Affiliation Identifier
- Identify collaborators or subject experts with Author Identifier
- Clarify your identity through integration with ORCID
- Benefit from indexing with Universal Discovery services: EBSCOHost, Primo and Summon
- Take advantage of interoperability with ScienceDirect, Mendeley, SciVal, Reaxys and Engineering Village

**Analyze**
- Track citations over time for a set of authors or documents with Citation Overview/Tracker
- Assess trends in search results with Analyze Search Results
- View h-index for specific authors
- Analyze an author’s publishing output with Author Evaluator
- Gain insight into journal performance with Compare Journals and alternative journal metrics SNIP, SJR and IPP
- Benchmark articles and decide what to read with the Articles Metrics module
1.2 Content Selection & Advisory Board

The Content Selection & Advisory Board (CSAB) was established in 2005 to promote an open and transparent content coverage policy. The Board consisted of a large independent group of established subject matter experts from around the world. The CSAB as we know it today was formed in 2009 and is now made up of 15 independent, international scientists, researchers and journal editors from all scientific disciplines and geographical areas. To see a roster of the CSAB members: http://www.elsevier.com/solutions/scopus/content/scopus-content-selection-and-advisory-board.

The CSAB’s primary function is to evaluate and determine which peer-reviewed titles are accepted into Scopus, and which are excluded. To ensure both the broadest coverage and highest quality content is included, the CSAB maintains and follows a transparent and robust selection policy. This policy is reviewed on a regular basis (see section 4.2).

Additionally, the CSAB is integral in determining content strategy by:

- Recommending long-term content approaches to ensure that Scopus remains focused on the research community’s information needs
- Keeping the Scopus team abreast of trends and developments in the research community, such as new standards, protocols or software with which to integrate

1.3 Purpose and scope

This document is designed to provide readers with a complete overview of all aspects of content coverage in Scopus.

Non-content aspects of Scopus (e.g., interface, search and other functionality) are not included within the scope of this document.
2. Coverage of source types

The source types covered in Scopus are either serial publications that have an ISSN (International Standard Serial Number) such as journals, book series and some conference series or non-serial publications that have an ISBN (International Standard Book Number) like one-off book publications or one-off conferences. To ensure that coverage, discoverability, profiles and impact measurement for research in all subject fields is accounted for, Scopus covers different source types.

In the table below, the figures in the columns highlight the significance of each content type per discipline. This analysis underpins a highly targeted approach for coverage of various source types for different fields.

### Percentage of Scopus serial publications

- **Active trade journals**: 1%  
- **Active book series**: 1.5%  
- **Active journals**: 61.9%  
- **Inactive journals, book series, trade journals**: 35.5%

2.1 Serial source types

Scopus indexes serial publications (journals, trade journals, book series and conference materials) that have been assigned an ISSN. The exception is conference papers, which enter Scopus through different methods than do serial publications with ISSNs (see section “Conference Material”).

**Journals**

Journals make up the bulk of the content in Scopus and can have various physical formats (e.g., print, electronic). Titles are selected according to our content coverage policy (for more information see section 4.2). Any serial publication with an ISSN, excluding trade journals, book series, certain proceedings, newsletters, secondary sources or patent publications, can be suggested for review and covered in Scopus.

**Trade journals**

Trade journals are serial publications covering and intended to reach a specific industry, trade or type of business. These publications are usually a magazine type of periodical with articles on topical subjects, news items and advertisements that appeal to those in the field. Trade journals are seldom refereed and do not always have an editorial board. Abstracts are usually short or nonexistent and few or no references are given. Usually an ISSN is available.

Trade journals are included in Scopus because users and librarians consider selected articles to be scientifically relevant. Only articles or reviews of scientific relevance are included in Scopus. The minimum requirements for trade journal items to be captured are: (1) minimum of one page, (2) minimum of one mentioned author (for more information about the regular document type policy, see section 3.1)

**Book series**

A book series is a serial publication that has an overall series title, an ISSN, and in which every volume and/or issue in the series is also a book with an ISBN. Usually, but not always, each book has a book title separate from the series title and a different editor or editors. Typically, each book is a monographic publication. Book series are usually published irregularly.

**Conference material**

Conference material enters Scopus in two different ways: (1) as a special issue of a regular journal, (2) as a dedicated conference proceeding.

Proceedings can be published as serial or non-serial, and may contain either the full articles of the papers presented or only the abstracts. The source title usually includes words like proceeding(s), meeting(s), conference(s), symposium/symposia, seminar(s) or workshop(s) (or their synonyms in other languages like Tagungsberichte, etc.), although some journals also include proceeding(s) in the title.

Scopus covers conferences that publish full-text papers, i.e., document type conference papers (see section 3.1), whereas conferences that publish only abstracts (meeting abstracts) are not considered for coverage.

Over 10% of the Scopus database is comprised of conference papers (over 7.2 million) of which 2 million are published in journals, book series and other sources. The remaining 5 million are published in conference proceedings.

Conference coverage in Scopus is focused primarily on those subject areas where conference papers represent a substantial portion of published research, e.g., engineering, computer science and some areas of physics.

A Conference Expansion Project completed in 2014 involved indexing over 1,000 conference titles, more than 6,000 conference events and over 400,000 conference papers, principally in engineering and computer science. The project indexed conferences from the big engineering publishers such as INSPIRES, ASEE and ASME.

In the Scopus title list (see section 4.1) there are over 26,612 conferences listed in the “Conf. Proceedings” tabs, 21,235 in the “Conf. Proceedings post-1995” tab and 5,377 in the “Conf. Proceedings pre-1996” tab. These are conference proceedings from which the meeting name was captured as part of the record data, but were not published as part of a serial publication with an ISSN.
2.2 Non-serial sources

A non-serial source is a publication with an ISBN unless it is a report, part of a book series, proceeding (non-serial) or patent. It can have different physical formats (e.g., print, electronic) and is usually a monograph or composed work.

Since August 2013, book coverage has expanded. Along with the existing book series, book content now includes monographs, edited volumes, major reference works and graduate level textbooks. Over 113,000 titles were added to Scopus in 2015, with a target of 120,000 titles expected to be reached by early 2016. Additionally, 10,000 titles will be added each year thereafter. This expansion significantly increases the breadth and depth of coverage for book-oriented disciplines in the social sciences and humanities.

Books are indexed on both a book and a chapter level. Book selection policy is publisher-based, meaning publishers are reviewed based on the relevancy and quality of their complete books list. Once a publisher is accepted, all books from that publisher that fit the scope of the project are indexed in Scopus. To see a list of the publishers included, please refer to the book title list: [http://www.elsevier.com/solutions/scopus/content](http://www.elsevier.com/solutions/scopus/content).

2.3 Other sources

Secondary documents

In Scopus, approximately 90 million records are non-core, or secondary documents. These are records that have been cited in Scopus core records, but are not themselves indexed in Scopus. The most highly cited of these non-core items are often books and older journal articles.

Patents

There are over 27 million patent records derived from five patent offices available in Scopus:

1. World Intellectual Property Organization (WIPO)
2. European Patent Office (EPO)
3. US Patent Office (USPTO)
5. UK Intellectual Property Office (IPO.GOV.UK)
3. Coverage of metadata

3.1 Document types

Scopus coverage focuses on primary document types from serial publications. Primary means that the author is identical to the researcher in charge of the presented findings. Scopus does not include secondary document types, where the author is not identical to the person behind the presented research, such as obituaries and book reviews (see section 2.2).

Scopus currently has over 60 million core records:

- Over 38 million records back to 1996 of which 84% include references
- Over 22 million records pre-1996 which go back as far as 1823 (abstracts included where available, but references are not included)
- Approximately 3 million new records are added each year (5,500/day)

As of December 2015, Scopus has added over 93 million pre-1996 cited references to over 5 million articles. This has been achieved in two ways: (1) by adding pre-1996 cited references to existing articles, and (2) by adding article back files, including their cited references, from the archives of 36 major publishers going back to 1970. These major publishers include: Springer, Wiley Blackwell, IEEE, American Physical Science and Elsevier. By the end of 2016, approximately 12 million articles will have gone through this process, adding an estimated 240 million pre-1996 cited references.
Document types covered in Scopus

<table>
<thead>
<tr>
<th>Document type</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Article</strong></td>
<td>Original research or opinion.</td>
</tr>
<tr>
<td></td>
<td>Characteristics: Articles in peer-reviewed journals are usually several pages in length, most often subdivided into sections: abstract, introduction, materials &amp; methods, results, conclusions, discussion and references. However, case reports, technical and research notes and short communications are also considered to be articles and may be as short as one page in length. Articles in trade journals are typically shorter than in peer-reviewed journals, and may also be as brief as one page in length.</td>
</tr>
<tr>
<td><strong>Article-in-Press (AiP)</strong></td>
<td>Accepted article made available online before official publication (see section 7).</td>
</tr>
<tr>
<td><strong>Book</strong></td>
<td>A whole monograph or entire book.</td>
</tr>
<tr>
<td></td>
<td>Characteristics: Book type is assigned to the whole. Additionally, for books with individual chapters, each chapter, along with a general item summarizing the book, is also indexed with the source type Book.</td>
</tr>
<tr>
<td><strong>Chapter</strong></td>
<td>A book chapter.</td>
</tr>
<tr>
<td></td>
<td>Characteristics: Complete chapter in a book or book series volume where the item is identified as a chapter by a heading or section indicator.</td>
</tr>
<tr>
<td><strong>Conference paper</strong></td>
<td>Original article reporting data presented at a conference or symposium.</td>
</tr>
<tr>
<td></td>
<td>Characteristics: Conference papers are of any length reporting data from a conference, with the exception of conference abstracts. Conference papers may range in length and content from full papers and published conference summaries to short items as short as one page in length (also see section 2.1).</td>
</tr>
<tr>
<td><strong>Editorial</strong></td>
<td>Summary of several articles or provides editorial opinions or news.</td>
</tr>
<tr>
<td></td>
<td>Characteristics: Editorials are typically identified as editorial, introduction, leading article, preface or foreword, and are usually listed at the beginning of the table of contents.</td>
</tr>
<tr>
<td><strong>Erratum</strong></td>
<td>Report of an error, correction or retraction of a previously published paper.</td>
</tr>
<tr>
<td></td>
<td>Characteristics: Errata are short items citing errors in, corrections to, or retractions of a previously published article in the same journal to which a citation is provided.</td>
</tr>
<tr>
<td><strong>Letter</strong></td>
<td>Letter to or correspondence with the editor.</td>
</tr>
<tr>
<td></td>
<td>Characteristics: Letters are individual letters or replies. Each individual letter or reply is processed as a single item.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Note, discussion or commentary.</td>
</tr>
<tr>
<td></td>
<td>Characteristics: Notes are short items that are not readily suited to other item types. They may or may not share characteristics of other item types, such as author, affiliation and references. Discussions and commentaries that follow an article are defined as notes and considered to be items in their own right. Notes also include questions and answers, as well as comments on other (often translated) articles. In trade journals, notes are generally shorter than half a page in length.</td>
</tr>
</tbody>
</table>
### Abstracts

Over 44 million records in Scopus contain an abstract in order to provide users with as much information as possible about the research presented in the database. Where available from the publisher, some records go back as far as 1823. The increased availability of abstracts in Scopus helps to ensure that users find all relevant results for their search across title, abstract and keywords.

### Document types not covered in Scopus

<table>
<thead>
<tr>
<th>Document type</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Review</td>
<td>Significant review of original research, also includes conference papers. Characteristics: Reviews typically have an extensive bibliography. Educational items that review specific issues within the literature are also considered to be reviews. As non-original articles, reviews lack the most typical sections of original articles such as materials &amp; methods and results.</td>
</tr>
<tr>
<td>Short survey</td>
<td>Short or mini-review of original research. Characteristics: Short surveys are similar to reviews, but usually are shorter (not more than a few pages) and with a less extensive bibliography.</td>
</tr>
</tbody>
</table>
3.3 Keywords and index terms

Scopus manually adds index terms for 80% of the titles included in Scopus. These index terms are derived from thesauri that Elsevier owns or licenses and are added to improve search recall. A team of professional indexers assigns index terms to records according to the following controlled vocabularies:

- Ei Thesaurus (engineering, technology, physical sciences)
- Emtree medical terms (life sciences, health sciences)
- MeSH (life sciences, health sciences)
- GEOBASE Subject Index (geology, geography, earth and environmental sciences)
- FLX terms, WTA terms (fluid sciences, textile sciences)
- Regional Index (geology, geography, earth and environmental sciences)
- Species Index (biology, life sciences)

There is no limit to the number of index terms that Scopus can add to records. However, in the case of Emtree and MeSH terms (both terms are added to records where available), only the index terms that have a direct relation with the topic of the article are displayed and made searchable on Scopus in order to avoid retrieving irrelevant results.

For Emtree, the index terms with a direct relation are the Major Focus and the mentioned index terms. For MeSH, the index terms with a direct relation are Major Topics and Minor Topics. For the Ei Thesaurus, the controlled terms, uncontrolled terms and main headings are displayed and searchable in Scopus. All index terms are displayed for the other subject indices.

For example, adverse drug reaction terms are only relevant when users are searching for articles in the context of adverse drug reactions, a feature which is only possible with the support of a thesaurus (not available in Scopus). For the same reason, for example, Ei treatment terms are not included in Scopus.

The Scopus capturing department assigns Chemical Abstract Service (CAS) numbers as part of the normal Emtree Drugs/Chemicals/Thesaurus indexing. Emtree has ca. 35,000 CAS numbers, which by no means is comparable with Chemical Databases. CAS assignment process is purely focusing on titles that are also covered by Embase. For example, searching for CASREGNUMBER(1*) in Scopus will retrieve 8.6 million items.

3.4 Cited references

Cited references in Scopus go back to 1970. Scopus announced the launch of the Scopus Cited References Expansion project in March 2014. Over the course of the project, Scopus has been adding cited references for pre-1996 content, going back to 1970. As of December 2015, Scopus has added over 93 million pre-1996 cited references to nearly 5 million articles. It is estimated that approximately 12 million articles will have undergone this process by the end of 2016, possibly adding approximately 240 million pre-1996 cited references.

The Cited References Expansion project’s two main benefits are:

1. Users can measure impact, perform historical trend analyses and conduct more accurate evaluations of authors who have published prior to 1996.

2. It provides more accurate and higher h-index rankings for those senior researchers – many of whom who subsequently have become key influencers and decision makers – who published most prolifically before the mid-1990s.

3.5 Affiliation data

It is possible to search Scopus based on affiliation data. The Scopus Affiliation Identifier automatically identifies and matches an organization with all of its research output. This tool is particularly relevant for deans, faculty heads and librarians in the academic market; researchers, project leaders and those involved in competitive intelligence in the corporate market; and funding bodies in the government market.

A task that once may have taken days to complete can now be done in a matter of minutes using a combination of sophisticated algorithms and a comprehensive knowledge base to disambiguate name variants and automatically identify and match most relevant records.

3.6 Author profiles

It is possible to search Scopus based on author data. The Scopus Author Identifier automatically identifies and matches an author with all of his/her research output. This tool is particularly relevant for analyzing citation metrics for authors, as well as specific articles by an author. The data can also be used to find authors or reviewers to collaborate with or for hiring purposes.

The Scopus Author Identifier assigns each author in Scopus a unique number and groups together all of the documents written by that author. To determine which author names should be grouped together under a single identifier number, the Scopus Author Identifier uses an algorithm that matches author names based on their affiliation, address, subject area, source title, dates of publication citations and co-authors.

An author can request corrections to their author details directly from their profile page using the Scopus Author Feedback Wizard. The Wizard guides the author through the steps of finding the correct profile(s) in Scopus and checking the publications it contains. Authors receive email notification when their requested changes are visible in Scopus. Profile changes are implemented within five working days.

3.7 ORCID integration

ORCID (Open Researcher and Contributor Identifier) is a nonprofit organization dedicated to solving the name ambiguity problem in scholarly research by assigning a unique identifier to each author. From their Scopus Author Profile, authors can import their list of publications in Scopus and their Scopus Author Identifier into ORCID. Once an author connects their ORCID record with their Scopus profile, a link to their ORCID record will appear on their profile page. Scopus and ORCID share and sync their data on a monthly basis. Learn more about ORCID at orcid.org.
3.8 Other metadata

PubMed ID

The unique identifier for MEDLINE documents, PubMed ID, is searchable via Advanced Search. When available, it appears on the record page (Abstracts & References page), as well as in the export of records.

Funding data

Since June 2013, grant numbers are available from the acknowledgement section on the relevant record page for content going forward.

These records include:
• Sponsor name
• Acronym
• Grant number

Funding information is captured if it is mentioned in the acknowledgement section of the article and if the funding body is included in the FundRef ontology: http://www.crossref.org/fundref/. At the start of capturing funding data (June 2013), around 5,000 funding bodies were included. Currently, the number of funding bodies has increased to over 11,000. The FundRef ontology is not complete yet and not all relevant funding bodies are covered at this time.

Open access

More than 4,200 journal titles are full open access (OA) journals. OA refers to journals in which all peer-reviewed scholarly articles are online available without any restrictions.

In Scopus, journals are registered as being OA journals only if they are registered as Gold OA or Subsidized OA at one or both of the following sources:
• Directory of Open Access Journals: https://doaj.org/
• Directory of Open Access Scholarly Resources: http://road.issn.org/

Please note that in Scopus, open access is only registered on journal level and not on article level.

For the full OA journal list, please download the Scopus Title list here: http://www.elsevier.com/solutions/scopus/content. In this list you can filter on OA status to see the full journal list.

Scopus includes an open access indicator for journals indexed in Scopus. The indicator allows users to easily identify open access journals within Scopus via the Browse Sources link. This link provides an alphabetical list of all journals, book series, trade publications and conference proceedings available in Scopus.
4. Coverage of sources (dating back to 1970)

4.1 Scopus title list

The Scopus Journals title list contains over 34,000 titles in total, including over 21,500 active titles and over 12,000 inactive titles (mostly predecessors of the active titles). The Scopus Books title list contains more than 116,000 books.

Complete lists of titles (for both journals and books) in Scopus are available externally from the Scopus info site at: https://www.elsevier.com/solutions/scopus/content.

The lists are identical to the list available on Scopus.com in the Browse Sources section.

The title lists and the sources section are updated 2-3 times per year and include only journals and books with substantial coverage on Scopus.com at the time of the update. Titles that are newly added to Scopus will be visible in the title list and the source section only as of the next update after the first content appears on Scopus. To check whether the content of recently added title is already available on Scopus, perform an advanced search on Scopus.com using the search code <srctitle> and entering the name of the title.

For more information about the Scopus subject areas, see section 4.4.

Which titles are included in the title list and source browse?

Neither the title list nor the titles included in the source browse on Scopus accurately reflect all the content in Scopus. In fact, the Scopus database contains records of 42,000 unique titles, which are all available via the Scopus basic search functionality. There are 8,000 titles, however, which are not included in either the title list or the source browse because these titles are:

- Stand-alone books and reports (i.e., books and reports that are not part of a book series). One-off book publications are listed in a separate book title list. Download the list from our info site: http://www.elsevier.com/solutions/scopus/content

- Pre-1996 discontinued (i.e., non-active) titles. Pre-1996 titles having child-parent relationships, however, are included (independent of the number of articles)

- Post-1995 titles with less than 25 articles, unless these appear to be newly started publications from the previous year and the current year. Post-1995 titles having child-parent relationships, however, are always included (independent of the number of articles)
4.2 Scopus title evaluation

It is estimated that there are between 80,000 and 300,000 scientific serial publications in existence worldwide. In order to ensure that Scopus remains the most relevant resource for all research in the sciences, technology, medicine, social sciences and arts and humanities fields, the CSAB continually reviews new titles for inclusion, using transparent selection criteria (see https://www.elsevier.com/solutions/scopus/content/content-policy-and-selection). New title suggestions may come from librarians, publishers and journal editors and can be submitted using the Title Suggestion form on the Scopus info site: http://suggestor.step.scopus.com/suggestTitle.cfm.

Scopus receives approximately 3,000 serial title suggestions on an annual basis. The number of suggested titles can vary significantly per subject area from only a few titles (e.g., in chemistry) to several hundred (e.g., in social sciences).

**Number of titles suggested for Scopus coverage per month**

![Chart showing number of titles suggested for Scopus coverage per month]

**Number of titles reviewed for Scopus coverage and acceptance rate of reviewed titles per month**

![Chart showing number of titles reviewed for Scopus coverage and acceptance rate]
Criteria for title selection

Titles should meet the following main eligibility criteria to be considered for review:

- Consist of peer-reviewed content
- Be published on a regular basis (have an ISSN number that has been registered with the International ISSN Centre)
- Be relevant and readable for an international audience (e.g., have references in Roman script and English language abstracts and titles)
- Have a publication ethics and publication malpractice statement

CSAB subject matter experts review titles using both quantitative and qualitative measures, and the selection is partly based on sample documents from the title. The criteria that will be used in the review process are grouped in five main categories: journal policy, content, citedness, regularity and online availability. These criteria can be found on the Scopus info site: http://www.elsevier.com/solutions/scopus/content/content-policy-and-selection.

The Scopus Title Evaluation Platform (STEP) (see below) enables the CSAB members to evaluate and add new titles on a continuous basis and to establish reliable turnaround.

Title re-evaluation

Curation of the data already covered in Scopus is no less important than the selection of content. Many journals benefit from the increased visibility and accessibility of their content through the global reach and use of Scopus, and we have observed this through an increase in output, citation and usage. However, there are also journals that alter their editorial policies and publishing standards and underperform over time.

As an incentive for journals to maintain their high content quality, Scopus re-evaluates low-performing journals based on a set of metrics and benchmarks and in comparison to peer journals in their subject fields. The set metrics and benchmarks are:

<table>
<thead>
<tr>
<th>Metric</th>
<th>Benchmark</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Self-citations</td>
<td>200%</td>
<td>The journal has a self-citation rate two times higher, or more, when compared to peer journals in its subject field.</td>
</tr>
<tr>
<td>Citations</td>
<td>50%</td>
<td>The journal received half the number of citations, when compared to peer journals in its subject field.</td>
</tr>
<tr>
<td>Impact Per Publication</td>
<td>50%</td>
<td>The journal has an IPP score half or less than the average IPP score, when compared to peer journals in its subject field.</td>
</tr>
<tr>
<td>Article output</td>
<td>50%</td>
<td>The journal produced half, or less, the number of articles, when compared to peer journals in its subject field.</td>
</tr>
<tr>
<td>Abstract usage</td>
<td>50%</td>
<td>The journal’s abstract are used half as much, or less, when compared to peer journals in its subject field.</td>
</tr>
<tr>
<td>Full text links</td>
<td>50%</td>
<td>The journal’s full text links are used half as much, or less, when compared to peer journals in its subject field.</td>
</tr>
</tbody>
</table>

Journals will receive a pre-warning if they do not meet the set benchmarks and will receive a one-year period to improve at least one metric. If the journal, after this one-year period, has not improved any metric, the journal will be re-evaluated by a CSAB member based on the transparent title evaluation criteria (see above) with the possible consequence of the journal being discontinued in Scopus. The re-evaluation process is an annual rolling process.
Content Selection & Advisory Board Subject Chairs

The Content Selection & Advisory Board comprises 15 subject chairs who are senior researchers, experienced in editorial roles, and are responsible for reviewing all the titles within a specific subject area. The subject chairs have the clear ownership per title in their respective area, and are ultimately responsible for the final vote as to whether a new journal title is included in Scopus. Subject chairs can choose to:

- Either reject/accept the submitted title based on his/her own judgment according to the Content Coverage Policy (see section 4.2: Scopus title evaluation), or
- Involve additional reviewers, who have the respective subject expertise and/or the language skills required to read and evaluate journals publishing in other languages than English

Scopus Title Evaluation Platform

The Scopus Title Evaluation Platform (STEP) is a web-based editorial system, streamlining the entire title evaluation process from submission until the final decision, including the feedback to the suggestor and publisher/editor of newly suggested titles. STEP offers several benefits, including:

- Those suggesting new titles receive feedback on why their title was accepted or rejected via a consistent process of communication
- Shorter decision-making cycle

When are new titles selected by the Content Selection & Advisory Board added to Scopus?

Once a title is accepted for inclusion in Scopus, the Elsevier Bibliographic Databases Operations department will contact the publisher in order to set up the content feed. After the content feed has been set up, it will take up to a few weeks before the title will be added to Scopus.

As per the above section on title re-evaluation, Scopus will, on an annual basis, curate the journal quality of all titles in the database.
4.3 Global coverage

Scopus coverage is global by design to best serve researchers’ needs and ensure that relevant scientific information is not omitted from the database. Titles from all geographical regions are covered, including non-English titles as long as English abstracts can be provided with the articles. In fact, approximately 21% of titles in Scopus are published in languages other than English, adding up to 40 local languages (or published in both English and another language). In addition, more than half of Scopus content originates from outside North America representing various countries Europe, Latin America and the Asia Pacific regions.

For a breakdown of titles per country, determined by the location of the publisher, you can download and sort the titles list by country and by publisher from: http://www.elsevier.com/solutions/scopus/content.

Number of titles in Scopus (active) vs. Web of Science geographical region (February 2014)

Number of journal titles by broad subject area. Note: Journal titles may belong to more than one subject area.
4.4 Subject area coverage

Scopus offers the broadest, most integrated coverage of peer-reviewed literature and quality web sources across the sciences, technology, medicine (STM), as well as social sciences and arts & humanities (A&H).

Titles in Scopus are classified under four broad subject clusters (life sciences, physical sciences, health sciences and social sciences & humanities), which are further divided into 27 major subject areas and 300+ minor subject areas. Titles may belong to more than one subject area. Download the title list on the Scopus info site: https://www.elsevier.com/solutions/scopus/content.

More than 21,500 titles in Scopus

Titles can be in more than one subject area
Arts & humanities

As of 2008, Scopus covered around 2,000 humanities titles. In 2009, to increase the number of humanities titles in the database, project MUSE (a not-for-profit full-text platform of many arts & humanities journals with international relevance from primarily US-based university presses) and the initial European Reference Index for the Humanities (ERIH) list were used to identify additional relevant titles. In 2011, a similar project was executed in which the coverage of the revised ERIH list, the Social Science Citation Index, the Arts & Humanities Citation Index, the titles list of Evaluation Agency for Research and Evaluation, France (AERES), and the humanities journal indexes Cairns and Francis were used. These journals were reviewed and added, together with the humanities titles selected for Scopus coverage via the Scopus Title Evaluation Process (STEP).

Scopus coverage has now grown to almost 3,500 humanities titles (4,200 when including humanities-related titles) and includes all serial publication types, such as journals, book series and conference series. Since 2014, more than 116,000 book titles have been added to Scopus. As more than 55% of the added book titles represent the arts & humanities and social sciences, this significantly expands the coverage for these areas. When combined with the strength of Scopus in bibliographic search, discoverability and evaluation tools, expanded coverage allows users to better measure the impact and scholarly achievement of the humanities in a more quantitative way.

At the moment, arts & humanities titles are part of the social sciences subject cluster in Scopus. Users can exclude or limit to arts & humanities results from their search results by using the refine results overview. For more information about subject areas in Scopus see section 6.

4.5 Complete coverage

Scopus was launched in late November 2004. At that time, Scopus contained 14,200 journals. There have been approximately 7,500 new titles added to Scopus since 2004. As per industry standards, Scopus does not backfill content for newly added journals, but rather begins coverage with the most recent journal issue in the year that it is accepted for inclusion in Scopus. However, if back file content for newly added journals is provided, Scopus may decide to cover the back files as well.

Upon the launch of Scopus, the decision was made to add cited references going back to 1996. In 2014, Scopus announced the launch of the Cited Reference Expansion project to include cited references in its database going back to 1970. By the end of 2016, a total of 240 million cited references will be added to approximately 12 million articles, coming from 36 major publishers and dating back to 1970. The project is expected to be completed by the end of 2016, with the majority of the project already completed in 2015.

Records pre- and post-1996

Scopus is 99% complete for titles originally included in Scopus back to 1996 (see beginning of section 4.5).

• 73% of all the articles in Scopus have an abstract going back as far as 1823
• 84% of all records after 1995 have abstracts

In response to market research and interviews with customers, Scopus has added back files (pre-1996) for journals from a variety of publishers back to volume 1, issue 1 where available (see above section).

4.6 MEDLINE coverage

MEDLINE is a database that can be hosted (via the free platform PubMed) by third parties, such as Ovid, Web of Knowledge, Embase or Scopus.

PubMed’s main component is MEDLINE, but it also contains other data. Scopus covers all 5,000 MEDLINE titles from 1966 and, as of 2010, also includes OLDMEDLINE content published between 1949 and 1965. For the majority of MEDLINE titles, Scopus has agreements with the publishers directly and receives the content from them. For the remaining journals (approximately 700) MEDLINE supplies Scopus directly and these titles are referred to as “MEDLINE sourced” in Scopus (previously MEDLINE unique). The advantages of covering MEDLINE in Scopus is that the MEDLINE records are fully integrated with the Scopus citation network and Scopus author profiles.
5. Processing of Scopus content

Obtaining content

Scopus content is obtained from over 5,000 publishers worldwide. Scopus has content delivery agreements in place with each publisher and receives content in both print and electronic formats. Currently, 85% of material is received electronically and/or sourced from the journal websites.

For over 85% of the journals in Scopus, the data from publishers gets delivered via e-Feeds (XML or PDF deliveries) or downloads from journal websites. This ensures the fastest possible processing and indexing. On average, fully-indexed article data will appear in Scopus within 2-3 weeks of publication on the publisher’s website. A diminishing number of publishers still supply their journal issues in paper format. Processing and indexing of such data usually takes 4-5 weeks, including distribution and delivery from publishers’ warehouses.

Articles-in-Press (AiP)

"Articles-in-Press" (AiP) are pre-published versions of accepted articles. AiP do not contain cited references and are de-duplicated once the final version is published and made available in Scopus. Publishers usually use a File Transfer Protocol (FTP) service to deliver the pre-published version to Scopus once it has appeared on their website. Once received, Scopus usually makes it available online within four days. The average time it takes before an AiP becomes a published article in a specific issue, however, can vary from weeks to months depending on how often the journal is published (e.g., bi-weekly vs. quarterly).

AiP for nearly 5,000 journals are provided by the following publishers:
- Cambridge University Press
- Elsevier
- Springer
- Karger Medical and Scientific Publishers
- Nature Publishing Group (NPG)
- The Institute of Electrical and Electronics Engineers (IEEE)
- BioMed Central (BMC)
- Lippincott, Williams & Wilkins (LWW)
- Thieme
- American Association for the Advancement of Science (Science)
- BMJ Publishing Group
- World Scientific
- Wiley Blackwell
- American Psychological Association (APA)
- Taylor & Francis
- Primary Care Respiratory Society UK (PCRJ)
Alerts can be set up in order to receive notification once an AiP is published as an article. Two alerts are needed:

1. DOCTYPE(AR) [article]
2. DOCTYPE(IP) [in press]

In order to search for published articles only (and not include AiP), the user must add the following criterion to their advanced search: AND NOT DOCTYPE(IP).

Another database with coverage of AiP is MEDLINE on PubMed. However, this “early view” layer is not part of the MEDLINE feed to 3rd party vendors, so Scopus does not receive AiP from MEDLINE. For more information about MEDLINE coverage see section 4.6.

Conclusion

This guide is updated annually and is designed to provide a complete overview of the content coverage in Scopus and corresponding policies. As Scopus is updated daily, the numbers presented in this guide may differ from current numbers. To find up-to-date content numbers, please refer to the content page of our info site: https://www.elsevier.com/solutions/scopus/content. The numbers presented on the info site are updated regularly throughout the year.
