Chapter 1

Introduction

This is the documentation of the family of Elsevier’s DTD 5 family of XML DTDs. This family is centred around the common element pool (CEP). In this version of the documentation, the following members of the family are described:

- the journal article (JA) DTD versions 5.0.1, 5.0.2, 5.1.0 and 5.2.0;
- the serial issue (SI) DTD versions 5.1.0 and 5.2.0;
- the EHS Book DTD versions 5.1.0 and 5.1.1;
- the Elsevier Book DTD versions 5.2.0, 5.2.1, 5.3.0 and 5.3.1;
- the Enhancement Fragment DTD 5.0.0;
- the common element pool (CEP) versions 1.1.0–1.1.6 and 1.2.0.

Historical remarks

Elsevier has a long tradition of using SGML (Standard Generalized Markup Language) for its products. In the 1980s, the CAPCAS DTD (Document Type Definition) was created to capture article frontmatters. In 1992, the first DTD for full-length scientific articles was developed [2].

CAP (Computer-Aided Production) started as a project in the 1990s, and is now the regular production method for Elsevier’s more than 1800 STM (science, technology and medical) journals and an increasing number of books, including all major reference works and book series. The consequence of CAP is that journal articles and book chapters are produced as full-text XML, and XML drives both the printed journals and books as well as the online versions on Elsevier platforms such as ScienceDirect (http://www.sciencedirect.com) and MDConsult (http://www.mdconsult.com), as well as many other platforms. Abstracts are extracted from the XML and find their way to destinations such as Scopus (http://www.scopus.com) and PubMed (http://www.ncbi.nlm.nih.gov).

Large-scale implementation of the “SGML-first workflow” began with the release of the full-length article DTD 3.0 in November 1995 and continued with the implementation of DTD 4.1, released in November 1997. Updates followed in February 2000 (DTD 4.2) and January and March 2001 (DTD 4.3). As from June 2005, SGML for journal articles was replaced by XML.

The DTDs 4.1–4.3 were described in the previous edition of the Tag by Tag [5].

DTD 5.0

The next generation of DTDs are XML DTDs. These were developed in 2001 and 2002. The business reasons for developing a new family of DTDs were as follows.

- The DTDs should cover all types of content, not just journal articles, but also book content, secondary publishing content, etc. They should be accompanied by new transport formats in the form of W3C schemas.
• The DTDs should be in XML.
• The DTDs should adopt Unicode. Unicode has become the standard for character sets. In the STIX project, Elsevier participated in order to ensure that the characters in the Elsevier Grid were represented in Unicode, although the chemical symbols were left out.
• The DTDs should incorporate MathML. The previous DTDs possessed their own, bespoke fragment for mathematical formulae. Some modifications were needed.
• The DTDs should incorporate CALS tables. CALS tables are widely used in other DTDs and software components for it are available. We have chosen the OASIS Exchange Format, and “extended CALS” tables had to be developed so that all tables occurring in STM articles can be captured.
• The DTDs should follow other XML standards. Where possible, and deemed useful, we have adopted the XLink standard, and we have used standard attribute names such as `xml:lang`.
• The DTDs should be more restrictive (in other words, more precise). The DTD has traditionally been very loose, meaning that it allowed constructs such as tables within footnotes within the first name of an author. Such constructs were prevented by semantic rules, enforced by the SGML quality control tools.

Adopting common international standards has not been without problems. Unicode contains a wealth of symbols, but at the time of introduction of the DTD, it lacked a number of symbols such as the chemical symbols present in the Elsevier Grid. MathML does not allow any parametrization. In particular, text portions appearing in displayed formulae cannot be structured—they must be plain characters. CALS tables turned out to be too poor for all varieties of tables encountered in scientific articles. Our desire to retain an “SGML/XML-First” workflow, i.e., a workflow in which the SGML/XML file is used to create all the products, be it print or electronic (see below), necessitated the introduction of table extensions. The fact that the CALS table model has no provision for namespaces complicated matters. In all these cases we were forced to modify the standards, with the risk of losing the benefits of adopting those standards.

The name “full-length article DTD” has been replaced by the more accurate name “journal article DTD”.

In order to maintain a consistent set of XML DTDs, the concept of a common element pool was introduced, described in more detail later. The individual DTDs make use of this pool.

Additionally, a distinction is made between input and output DTDs, where “input” and “output” relate to Elsevier’s Electronic Warehouse. The input DTD is geared towards supplying XML documents, whereas the output DTD facilitates rendering using stylesheets—the latter features, for instance, information about height and width of figures.

The project to create and implement the DTD 5 family of DTDs was called “Hawaii 5.0”.

How to read this documentation

This documentation is not intended as an introduction into XML. It is assumed that the reader is familiar with XML terminology, and can read XML fragments.

This documentation alone is not sufficient to describe electronic deliveries to and from Elsevier. It should be read together with
• the Guide for MFC activities, containing copy-edit instructions;
• the Typographic Standardization and the journals’ typesetting instructions, containing the default rendering of the SGML/XML files on paper;
Electronic Warehouse input and output specifications, detailing the structure of electronic datasets.

**CAP, CAPLite, CAPLitePlus**

A CAP delivery of an item contains a PDF file (Portable Document Format from Adobe) and an XML file capturing the full item as well as all external files (“assets”) referred to from the XML file.

For some types of content, e.g. camera-ready journals, delivery of full-article XML is not a viable alternative. For these types of content, the full-article PDF file is required, but only the head and the tail are captured in XML (the definition of “head” and “tail” are given in later chapters). In total, four varieties of XML capturing are distinguished:

- **CONTENTS-ENTRY-ONLY.** Only the title and authors are captured, also known as “ultralight” deliveries.
- **HEAD-ONLY.** Only the head is captured, also known as “CAPLite” deliveries.
- **HEAD-AND-TAIL.** Only the head and the tail are captured, also known as “CAPLite-Plus” deliveries.
- **Full CAP:** the whole article is captured.

The DTDs support these different “XML manifestations”, and they are also dealt with in this documentation. Fortunately, these manifestations limit themselves to a small number of publications.

There is a difference between a HEAD-ONLY document and a full CAP document that only contains a head. In the latter case, one can be sure that the document is nothing more than the head. In the former case a body and a tail may or may not have been present. Interpreting the XML file and concluding the file is HEAD-ONLY is therefore wrong. It must be concluded from the manifestation type indicated by the dataset description.

**SGML/XML First**

The core principle of the CAP workflow has always been “SGML/XML First”. This means that all products, be it online or in print, are derived from the same source SGML/XML file. The PDF files used for print are as much derived from the XML as the online product. If one would define XML First as “Give a valid XML file to any supplier, then each supplier will produce the same PDF file”, one can say that XML First is achieved for the majority of journal titles. For some nonstandard titles, and for some book projects, the layout requirements are so important that full compliance to the XML First Principle is not always possible.

For PreCAP, where printed journal issues are scanned and delivered electronically, the principle obviously does not apply.
Chapter 2

Technical aspects

This chapter contains technical details of the Elsevier DTD family and the XML files that are structured according to these DTDs.

- The first section, The setup of the DTD family (p. 8), describes the general set-up of the DTD 5.0 family, with several DTDs calling in the common element pool, which in turn uses the MathML and CALS DTDs.

- The second section, The XML files (p. 12), explains general rules for each XML file, such as its UTF-8 encoding and whitespace rules.

- Each XML file structured according to one of the Elsevier DTDs begins with a doctype declaration and the declaration of external entities, if any. This is described in the third section, Entities and the DOCTYPE declaration (p. 14).

- The fourth section, The DTD version of an XML file and catalogs (p. 16), stresses that the authoritative version of the DTD with which an XML file is structured is found using the public identifier in the doctype declaration.

- Extensive use of namespaces has been made. This is detailed in the fifth section, Namespaces in the XML file (p. 18).

- The Unicode standard misses some crucial symbols that are used in Elsevier’s XML files. The additional glyphs are listed in the sixth section, Elsevier’s additional glyphs (p. 27).

- MathML formulae and extended CALS tables are accompanied by a graphical representation, called a strip-in. General rules for strip-ins are described in the final section of this chapter, strip-ins (p. 31).
The setup of the DTD family

This section describes the setup of the DTDs, the common element pool and the corresponding namespaces.

In order to manage a family of XML DTDs, a modular approach was adopted. The DTDs belonging to the DTD 5 family use a common element pool (CEP), consisting of elements shared by various DTDs. In turn, the common element pool includes other DTD fragments, e.g. MathML and CALS tables.

As a result, the individual DTDs are mostly fairly small; they describe the top-level structure of the content. Some DTDs are different by nature, such as the serials issue (SI) DTD and the Elsevier Book (BK) DTD, and therefore use fewer common elements.

Namespaces

Even though DTDs, unlike, e.g., XML schemas, offer limited support for namespaces, these have been introduced in the DTD 5 family, and these play a role when processing files using namespace-aware software. For instance, XSLT stylesheets are aware of the namespace and unexpected results can be obtained when the namespace is not taken care of. The namespaces are named using URIs — these are abstract names not pointing to any page on the Elsevier corporate website. The following namespaces are the namespaces used in the DTD 5 family.
Chapter 2 – Technical aspects

The setup of the DTD family

<td>MathML</td>
</tr>
</tbody>
</table>

The namespaces existing within the DTD and the common element pool are declared in the top-level element. The MathML namespace is declared in the MathML Qualified Names Module.

The convention is adopted that the elements indigenous to the DTD belong to the default namespace. Therefore within the family of DTDs two different elements with the same name can exist. Namespace-aware processors will treat each variant differently.

The other elements are explicitly prefixed in the DTD: all elements in the common element pool have been given a prefix ce: or, for elements for structured bibliographic references, sb: or, for elements for structured affiliations, sa:; or tb: for elements that extend the CALS table model. The MathML elements have been assigned a prefix mml:.

An unfortunate exception is formed by the elements in the CALS table fragment. Since that fragment lacks the option to declare a namespace prefix, they all have no prefix, even though they belong to the common element pool. In order to avoid that XML processors treat these elements as belonging to the default namespace of the DTD, the element ce:table resets the default namespace to the CALS namespace. The element entry resets the default namespace to that of the common element pool.

More details can be found in the section Namespaces in the XML file (p. 18).

MathML, CALS

The common element pool pulls in MathML and CALS fragments. It should be noted that it is important to use for these fragments the files belonging to the common element pool distribution, rather than files found elsewhere. These files contain the correct version, corresponding to the Public Identifiers defined in the common element pool.

Doctypes

In order to make the DTDs more precise, they may contain more than one top-level element, the doctype. Other documentation gives instructions about when a certain doctype is appropriate. For instance, article and book-review are doctypes defined by the journal article DTD (JA DTD). A full-length article begins as follows:

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<!DOCTYPE article PUBLIC "-//ES//DTD journal article DTD version 5.0.1//EN//XML" "art501.dtd" []>
<article docsubtype="fla">
```
whereas a book review begins thus:

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<!DOCTYPE book-review
 PUBLIC "-//ES//DTD journal article DTD version 5.0.1//EN//XML"
 "art501.dtd" []>
<book-review docsubtype="brv">

Similarly, the books DTDs contain doctypes (top-level elements) for the chapters, the index, the glossary, and the book “hub”.

Version numbering

It is likely that development of the individual DTDs will require changes to the common element pool. As a consequence, it is likely that different versions of the common element pool will be in use at any one time. For instance, the major reference works DTD might need version 1.2 of the common element pool, while the journal article DTD does not need an update and continues to use the common element pool version 1.1.

The correct version number of the DTD is found in the public identifier of the DTD. (See the section The DTD version number and XML catalogs, p. 16.) A DTD change that results in a change of the second or third digit will always be a backward compatible one.

In case of a change to the third digit, note that the version attributes of the top-level elements do not contain the third digit. Therefore, a file structured according to version 5.2.0 will still parse with version 5.2.1 without any change to the XML file. The only thing an application needs to do is to change the catalog (p. 14) in such a way that the public identifier of the 5.2.0 DTD points to the 5.2.1 file.

Backward compatibility and downgradability

After a DTD has gone into production, limitations of backward compatibility and downgradability are put on the DTDs.

Backward compatibility means that applications that can handle documents conforming to a certain version, can also handle documents conforming to a previous version.

Downgradability means that applications that cannot yet handle documents conforming to a newer version, can downgrade these documents or receive documents already downgraded.

In complex situation where many thousands of web services, tools and applications use the XML content, it is impossible to lockstep migration with a DTD upgrade. Therefore these limitations are needed.

Making an element optional is backward compatible, but it is only downgradable if a default value can be supplied in case the element is not present in an XML file. For instance, when a city element in an address were to be made optional, older documents are still valid with the new DTD, but it is virtually impossible to scan the affiliation and automatically tag the city in order to downgrade the file.

Making an optional element mandatory is downgradable but not backward compatible as applications that only know about the new DTD will expect the potentially missing element in the XML file. However, for applications that could already handle the optional element the added precision that the element will henceforth always be present is only helpful.

Adding a new, optional element is both backward compatible and downgradable. Adding a new, mandatory element is neither backward compatible nor downgradable.
Only first-digit changes do not need to be backward compatible or downgradable. The 4.x DTDs have existed for 6.5 years and the family of 5.x DTDs will be with us for many years as well.
The XML file

This section describes various rules about the XML files themselves.

Valid files

Obviously, the XML file must be a valid XML instance. A consequence is that the file is well-formed: that it contains entities properly closed with a semi-colon, and that the `<` and `&` characters are only used as XML markup. The file must begin with the XML version declaration including the UTF-8 encoding statement

```xml
<?xml version="1.0" encoding="UTF-8" ?>
```

Nothing may appear before that statement, between that statement and the DOCTYPE declaration, and after the end tag of the top-level element.

UTF-8 encoding

Elsevier expects XML files to be delivered in UTF-8 encoding. This encoding, in which each Unicode point is stored as a sequence of one or more bytes, is the only encoding allowed.

Beside the native UTF-8 encoding of the Unicode point, it is also allowed to use explicit character numbers such as `&#x0200B;`. Alternatively, the entity name can be used if the entity belongs to one of the ISO characters sets pulled in by the MathML DTD or if it belongs to the ESextra collection. For MathML symbols in Plane One it is required to use math variants.

Hence, the following code results in three times “é”:

é &acute; &#x00E9;

By the first we mean é in its native UTF-8 encoding. (Note that in that encoding the character is not hex E9 but is encoded as the two-byte sequence C3 A9.)

All these three instances are identical. It is wrong to perform character manipulation on a raw XML file: it does not make sense to make a difference between the character entity and the other two variants.

Outside markup, `<`, `"` and `&` are always escaped and present in their pre-defined entity forms `&lt;`, `&quot;` and `&amp;`.

Whitespace in the XML file

In this section, “whitespace” refers to the space character (ASCII 32), the linefeed (LF) character (ASCII 10) and the TAB character (ASCII 9). Each of these characters has the same effect: a space in the rendered document.

Unlike the SGML files structured according to DTDs prior to DTD 5, DTD 5 XML files may contain TABs and linefeed characters for ease of reading XML files with the human eye. The carriage-return (CR) character (ASCII 13) is not allowed; line breaks therefore do not follow the MSDOS pattern CRLF.

When a sequence of consecutive whitespace characters appears in an XML file, the effect is as if one space were present. These sequences may only occur at the beginning of a line.

Care should be taken when using whitespace at the beginning or end of mixed-content elements, i.e., with `#PCDATA` in their content model.
There are five whitespace characters between “(the” and “linefeed”, which is allowed; they count as one space. The three whitespaces after the full stop, however, are not correct. (It follows from the DTD that the three whitespace characters after the end tag are ignored.)

It should be noted that in some of the examples in this documentation, erroneous extra spacing has sometimes been introduced to make the examples easier to read. The close-up sign ▼ is used in that case to make it clear that the XML files should have no spaces or linebreaks at this point.

XML

<ce:caption>
<ce:simple-para>The close-up sign indicates that there should be no whitespace at the end of the paragraph; the end tag is placed on the next line only for reasons of readability. ▼
</ce:simple-para>
</ce:caption>
Entities and the DOCTYPE declaration

The relationship between the XML file and the artwork files and files containing electronic components is made via XML entities. These entities are used exclusively in the `ce:link` element and must be declared within the declaration subset of the XML file according to the rules described in this section.

Consider a journal article consisting of an XML file `main.xml`; three artwork files `gr1.jpg`, `gr2.jpg` and `fx1.tif`; an audio file `au1.mp3` and a videoclip `clip.avi`.

The XML file of the article, structured with the journal article DTD, begins like this:

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<!DOCTYPE article
 PUBLIC "-//ES//DTD journal article DTD version 5.0.1//EN//XML"
 "art501.dtd" [
  <!ENTITY gr1 SYSTEM "gr1" NDATA IMAGE>
  <!ENTITY gr2 SYSTEM "gr2" NDATA IMAGE>
  <!ENTITY fx1 SYSTEM "fx1" NDATA IMAGE>
  <!ENTITY au1 SYSTEM "au1" NDATA AUDIO>
  <!ENTITY clip SYSTEM "clip" NDATA VIDEO>]
<article docsubtype="fla">
  ...
</article>
```

The entities `gr1`–`clip` are used in the `ENTITY`-type attributes of the element `ce:link`. The system names are the file names without extension. The external entity name must be the same as the system name.

The actual link is established in a three-step process, starting with its usage within the document which looks like this:

```xml
<ce:biography id="vt1">
  <ce:link locator="fx1"/>
  <ce:simple-para>...</ce:simple-para>
</ce:biography>
```

The `ce:link` element instructs the rendering application to pull in an external file. It is the file referenced through the entity `fx1`, the value of the `locator` attribute, that is declared in the doctype declaration as the external entity with system name (i.e., file name) `fx1`. The `catalog` redirects this to `fx1.tif`.

In the declaration subset (between square brackets), it is only allowed to declare entities of the types NDATA. The notations defined in the DTD are TEXT, reserved for plain text; IMAGE, reserved for artwork formats such as GIF, JPEG and TIF; AUDIO, reserved for audio formats such as MP3; VIDEO, reserved for video formats such as AVI, MP4 and MPEG; APPLICATION, reserved for documents for other applications or for scripts and executables; and XML, reserved for external XML files, e.g. for scalable vector graphics or chemical object notations. (Not all these notations are currently used.) Precisely those entities needed in the document must be declared.

Applications that wish to check whether all external files are present should examine the declaration subset of the XML file and verify these against the dataset.

Obviously, only files referred to from the XML file are declared as entities as described.
above. Other files belonging to the item, such as PDF files, are not mentioned in the XML file.
An XML file's DTD version and catalogs

It is expected that the public identifier in the DOCTYPE declaration of the XML file is used to retrieve the DTD as well as its version number. The *version* attribute of the top element should not be used as it only contains the first two digits of the DTD version number for reasons of backward compatibility (p. 8).

```
XML
<!DOCTYPE simple-article
  PUBLIC "//ES//DTD journal article DTD version 5.0.1//EN//XML"  
  "art501.dtd">

<!DOCTYPE serial-issue
  PUBLIC "//ES//DTD serials issue DTD version 5.1.0//EN//XML"  
  "si510.dtd">

<!DOCTYPE ehs-book
  PUBLIC "//ES//DTD ehs book DTD version 5.1.1//EN//XML"  
  "ehs_book511.dtd">

<!DOCTYPE book
  PUBLIC "//ES//DTD ehs book DTD version 5.2.1//EN//XML"  
  "book521.dtd">

<!DOCTYPE converted-article
  PUBLIC "//ES//DTD journal article DTD version 4.5.2//EN//XML"  
  "art452.dtd">
```

The string after the keyword *PUBLIC* contains the DTD associated with the XML file that has this DOCTYPE declaration. The system identifier does not contain that information. To map the public identifier to a file on the user's system XML catalogs should be used as explained below.

**XML catalogs**

Catalogs are an important tool in entity management: they allow XML tools to locate DTDs and other external files that are used by the XML file. Catalogs make entity management flexible: they allow us to associate system identifiers (file paths and names) to public identifiers, and to rewrite system identifiers.

During the SGML era the SGML Open Catalog (SOC) specification was developed [16]. James Clark’s SP suite is a well-known application implementing SOC, and it was the only application that implemented system identifier rewriting.

XML has long done without its own entity resolution system. It had the new rule that even the declaration of a public identifier had to contain a system identifier, which allowed external entity handling to be simple. Some applications continued to use the SOC system. On 6 August 2001 and again on 24 October 2002 OASIS published its XML Catalog specification [17]. It can be seen as a continuation and a refinement of the SOC system. It provides powerful methods to map public identifiers to system identifiers, to rewrite system identifiers, and to modularize catalog management. At the time of this writing several XML toolsets contain implementations of this catalog specification; for an overview see the home page of OASIS’ catalog committee [18].

16 Elsevier Documentation for the XML DTD 5 Family
XML

```xml
<?xml version="1.0" encoding="UTF-8" ?>
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog"
    prefer="public">

    <public
        publicId="-//ES//DTD journal article DTD version 5.0.1//EN//XML"
        uri="file:///D:/home/xml/dtd/art500/art501.dtd"/>

    <group xml:base="file:///D:/home/article/">
        <system systemID="gr1" uri="main.assets/gr1.tif"/>
        <system systemID="gr2" uri="main.assets/gr2.tif"/>
    </group>

    <group xml:base="file:///D:/home/xml/dtd/">
        <nextCatalog catalog="mathml/xcatalog"/>
        <nextCatalog catalog="calstable/xcatalog"/>
    </group>

    <rewriteSystem systemIdStartString="file:///D:/home/article/">
        rewritePrefix="file:///G:/datasets/20030310/art5001/"/
    </rewriteSystem>

</catalog>
```

The above example catalog starts with specifying where the JA DTD can be found. Note that this ignores the system identifier for this DTD in the XML file itself. Also note that this is a local implementation, on other systems the DTD may be located elsewhere.

Then the system identifiers for the images in the XML file discussed above are mapped to an existing file location. Note that a subdirectory is specified and a file name extension is given.

Then two other catalogs are included, for the MathML DTD and the CALS table DTD. This makes it possible to maintain separate catalogs for these subsystems.

Finally some system identifiers are rewritten. Rewriting applies to the start of the system identifier. Here a situation is described where all data for the article have been moved from one place to another.

XML catalogs provide more facilities for entity management. See the specification [17] for details.

Note that using catalogs in this way makes it possible to perform a third-digit update of the DTD by changing the catalog in such a way that the public identifier of the old and new versions both point to the new DTD.
Namespaces are widely used in programming. XML has introduced namespaces to text structuring. Namespaces allow one to reuse commonly used names. For example, the element title may have a different content model in one namespace than in another. More importantly, namespaces allow one to group related elements together, and separate them off from other groups of elements.

Namespaces are indicated by their name. In XML, the name is a URI. Usually it is a URL, e.g. http://www.elsevier.com/xml/common/dtd. Sometimes it has a rather different form of URI, e.g. urn:oasis:names:tc:entity:xmlns:xml:catalog, which is the name of the namespace of an XML catalog.

In an XML document namespaces are indicated by prefixes. A prefix is an alias for a namespace name. Prefixes are defined according to a flexible system. Each element in an XML document may declare prefixes for one or more namespaces using the attribute xmlns:pfx="name", where pfx is the newly declared prefix. This prefix is valid for this element and all its descendants, until it is redeclared by another xmlns attribute. One may also declare a default namespace, with the attribute xmlns="name". This causes this element, if it does not have a prefix, as well as all its descendants without a prefix, to belong to the declared namespace. When there is no default namespace declaration, all elements without a prefix do not belong to a namespace. One could also say that they belong to the namespace with an empty name.

This flexible system does not fit well into the DTD system. A DTD is not namespace aware. In a DTD the prefix is a fixed part of an element’s name. It must be used as determined by the DTD, and cannot be redeclared in the XML document. If one would redeclare a prefix as described above, the document would become invalid according to the DTD. Some flexibility can be gained by writing the DTD in such a way that the prefix is determined by an entity. This allows one to declare a different prefix at the top of each XML document. The CEP does not use this flexibility, and fixes the prefixes used.

The CEP and the DTDs built on top of it, do all namespace declarations in the DTD, by means of attributes with fixed values. This has the advantage that no namespace declarations are required in the XML document. For a proper understanding that may be a disadvantage, because in the XML document the namespaces are rather invisible. Only by looking up the DTD can one find out in which namespaces the elements live.

In the XML world there are namespace-aware applications and non-namespace-aware applications. DTDs are not namespace aware. For a DTD the prefix is just a part of the element name, and a namespace declaration is an attribute like any other. Parsers may be namespace aware. This makes it possible to inquire in which namespace an element lives. In our first example we make use of this facility.

XSLT processors are namespace aware. They read the DTD and pick up any namespace declarations. Therefore they know in which namespace each element of the XML source document lives, including those without a prefix. If the stylesheet specifies a match with an element, the processor matches the element’s name and the namespace. If the namespaces are not the same, there is no match. This may sometimes come as a surprise, especially for elements in the default namespace. In our second example we will demonstrate this.
Example 1

In this example we first show a short XML document according to the JA DTD. Then we show an outline of the document, and list for each element to which namespace it belongs. Finally we provide some explanation.

The namespace listing in this example was obtained from a SAX2 parser, which reports the namespace URI as the first argument of the callbacks `startElement` and `endElement`.

```
<?xml version="1.0" encoding="UTF-8"?>

```
Cutaneous photodamage

Sheldon R. Pinnell, MD

Durham, North Carolina

New methods.

Sunlight coupled [1][1]
The following table shows the namespaces with which the elements of the article are associated. In the right column the name of the namespace is given. Here the string http://www.elsevier.com/xml/, which is common to all namespace names in the CEP and the DTDs built on top of it, has been omitted for brevity. In the left column the element name is given. Here the structure of the article is indicated by indentation. If an element is indented with respect to a previous element, it is contained in that element.

See the explanation below the table.

Explanation

The elements article, item-info, jid, aid, head, body and tail, which have no prefix, are in the namespace http://www.elsevier.com/xml/ja/dtd. This is so because on the article element the DTD declares the namespace http://www.elsevier.com/xml/ja/dtd as the default namespace.

All elements with the prefix ce are in the namespace http://www.elsevier.com/xml/common/dtd. This concerns most elements in a journal article.

A somewhat complicated situation arises at the ce:table element. On this element the DTD declares that the namespace http://www.elsevier.com/xml/common/cals/dtd becomes the default namespace. This means all elements below the ce:table element which do not have a prefix, belong to the namespace http://www.elsevier.com/xml/common/cals/dtd. This applies to the elements tgroup, colspec, thead, tbody and row. A few elements in the table have the prefix tb. This indicates that they are in the namespace http://www.elsevier.com/xml/common/table/dtd, which is the namespace of extensions to the CALS table model.

On the entry element the DTD declares that the namespace http://www.elsevier.com/xml/common/dtd becomes the default namespace. Despite the fact that the element entry does not have a prefix ce, it does belong to this namespace. This namespace emphasizes the fact that the content model of entry is determined by the CEP, not by the CALS table model.

Elements with the prefix sb only occur in structured references, starting with the top element sb:reference. They are in the namespace http://www.elsevier.com/xml/common/struct-bib/dtd. Structured references also contain a few elements that belong to the namespace http://www.elsevier.com/xml/common/dtd (prefix ce).

Example 2

In this example we first show a simple XSLT stylesheet, which we apply to the document of example 1. It contains two templates for each of the elements item-info, row and entry, one with and one without prefix. Only one template of each pair will produce a match. Next we show the resulting HTML document. Finally we provide some explanation.

</table>
</body>
</html>
```

Elsevier Documentation for the XML DTD 5 Family

25
Explanation

The XSLT stylesheet starts by declaring prefixes for all namespaces used in a JA article. It uses the same prefixes as the DTD. This is not required. One is free to use any prefix, regardless of the prefixes used in the source XML document. Of course, selecting the same prefixes adds clarity. Note that the stylesheet also declares a prefix for the namespace http://www.elsevier.com/xml/ja/dtd, which is the default namespace in the source XML document. In the stylesheet the default namespace has no name. This is required because its output is an HTML document, which does not use namespaces.

The output HTML document also starts with namespace declarations. The XSLT processor inserts all namespace declarations that it knows of. In this case it is quite useless, but because HTML browsers ignore attributes they do not recognize, it does not harm.

The XSLT stylesheet has two templates for the element item-info. One template matches the element in the default namespace. The other template matches the element in the namespace http://www.elsevier.com/xml/ja/dtd. Their output is slightly different. The latter template adds the string '(JA:)' to the header.

The resulting HTML document makes it clear that only the template using the ja prefix has produced a match. The source document does contain an element item-info in the http://www.elsevier.com/xml/ja/dtd namespace, and it does not contain an element item-info without a namespace. This is despite the fact that the XML document itself does not show the namespace; the namespace declaration is hidden in the DTD.

Similarly, the XSLT stylesheet contains two templates for the element row and two for the element entry. Again they produce slightly different output. The resulting HTML file shows again that the templates with a prefix have a match, and those without a prefix do not. In agreement with the table in example 1, we use the http://www.elsevier.com/xml/common/cals/dtd namespace for the row element, and the http://www.elsevier.com/xml/common/dtd namespace for the entry element.
Elsevier’s additional glyphs

Not all symbols used in our publications have been adopted by Unicode. Prior to DTD 5.0, these symbols were part of the “Elsevier Science Grid” [5]. The element `ce:glyph` has been introduced so that we can continue to support these additional symbols.

It is expected that some or all of the glyphs may be added to future versions of Unicode. In that case, it is not an error to use the `ce:glyph` element, but it is preferred that the Unicode character is used.

The list of glyph names allowed in `ce:glyph` is contained in the parameter entity `%glyph-names;`. The following two tables give an overview of the glyph names and the symbols to which they refer. The position refers to the position in the Grid [5]. When a Unicode code point has been assigned to a symbol, it is listed in the column Unicode.

Rendering applications need to store these glyphs, they are not delivered along with the XML files as are strip-ins (p. 31).

Strip-in images

Since Elsevier began delivering SGML files for electronic products, the files have been accompanied with graphic representations of SGML expressions that are hard to render. Prior to DTD 5.0, these included all accent constructions, all formulae and all tables. Graphic representations of these constructs are called strip-ins. These strip-ins were created by Elsevier’s Electronic Warehouse from the SGML source.

Strip-ins should not be confused with graphic images of symbols in the Elsevier Grid that cannot be represented in today’s HTML-based browsers. Such images, seen on platforms such as ScienceDirect®, look the same as strip-ins, but are held in glyph libraries of the platforms. With the adoption of Unicode, graphic representation of symbols will become a thing of the past.

Some constructs in an XML file structured by one of the DTDs of the 5.0 family are still hard to render on today’s browsers.

- MathML (Chapter 11) is not yet supported natively in the important browsers that Elsevier’s readers use, although we expect that to change in the near future. After some time in which readers switch to the newer version, we can assume that MathML can be rendered without problem. At present, however, we continue to supply strip-ins for the element mml:math.

- We expect that native CALS tables (Chapter 12) can be rendered in today’s web browsers, but the more complicated extended CALS tables are a different matter. These require complicated border styles or complicated alignment that is not possible. For tgroup elements with extensions with the tb: prefix, we also supply strip-ins. Unlike strip-ins for math, these strip-ins may well continue to be supplied in the future.

Both the mml:math and the tgroup elements possess an attribute altimg that contains the filename of the strip-in image. Note that unlike other external files, the link is not made via an entity (as described in the section Entities and the DOCTYPE declaration, p. 14).

XML

```
<mm:math altimg="si10.gif">...</mml:math>
<tg:group altimg="si103.gif">...</tg:group>
```

The strip-in images are GIF images of the typeset output found in the PDF file of the document. The GIF images are specified in more detail elsewhere. Some points to note:

- Strip-ins are cropped closely. The current specifications do not allow the baseline to be specified. This is only a potential problem for small inline formulae, not for displayed formulae or tables.

- Strip-ins of displayed formulas look identical to the PDF version, except when a column or page break appears right in the middle of them. So, in a two-column journal they might look narrow and in a one-column journal they will be wider.

- Strip-ins of inline formulas look identical to the PDF version except when a line break happens to appear in the middle of them. The strip-in image will appear unbroken.

- Strip-ins of tgroup are always one GIF image, irrespective of the height and width of the table.
This chapter contains an alphabetic listing of the elements in the journal article DTD, JA DTD. This DTD is used for capturing journal articles. It is also applied for structuring chapters of certain types of books, e.g. chapters in volumes of book series.

The JA DTD is the successor of the SGML full-length article DTDs.

The journal article DTD defines four top-level elements: article, simple-article, book-review and exam.

The serial issue DTD, SI DTD, described in Chapter 4, is a related DTD. It is used for capturing the data belonging to a journal issue or a book series volume.

CEP version used in this DTD

The journal article DTD versions described in this documentation use different versions of the common element pool, as follows:

<table>
<thead>
<tr>
<th>Journal article DTD</th>
<th>Common element pool</th>
</tr>
</thead>
<tbody>
<tr>
<td>JA DTD 5.0.1</td>
<td>CEP 1.1.0</td>
</tr>
<tr>
<td>JA DTD 5.0.2</td>
<td>CEP 1.1.0.1</td>
</tr>
<tr>
<td>JA DTD 5.1.0</td>
<td>CEP 1.1.5</td>
</tr>
<tr>
<td>JA DTD 5.2.0</td>
<td>CEP 1.2.0</td>
</tr>
</tbody>
</table>

Parameter entities

The journal article DTD versions 5.0.1 and 5.0.2 locally declare parameter entities %cross-ref; and %cross-refts; to consist of ce:cross-ref and ce:cross-refts, respectively.

```xml
<!ENTITY % cross-ref "ce:cross-ref" >
<!ENTITY % cross-refts "ce:cross-refts" >
```

As a result, it is impossible to use ce:intra-ref and ce:intra-refts in documents structured with these versions of the JA DTD.

This restriction is removed in JA DTD 5.1.0.
aid

Declaration

Model (JA DTD 5.0.1–JA DTD 5.2.0)
<!ELEMENT aid ( %string.data; )*>

Description

The element aid contains the article number of the item.

Usage

The article ID is captured using aid. Article IDs have no leading zeroes.

  docsubtype %docsubtype; "fla">
```

Description

The element `article` contains a complete journal article or a complete book chapter.

Usage

The element `article` is one of the top-level elements (doctype) of the JA DTD. It is used for structuring full-length articles and other articles of scientific importance.

There are several attributes of the element, as follows.
The attribute \texttt{docsubtype} is the most important one. It defaults to \texttt{fla}; its complete list of values is described in the section \textit{Publication item types} (p. 58). Under regular production conditions, articles with this attribute set to \texttt{chp}, \texttt{fla}, \texttt{rev}, \texttt{seo} or \texttt{ssu} will be structured with \texttt{article}. However, a \texttt{CONTENTS-ENTRY-ONLY} full-length article may well be structured using \texttt{simple-article}. The precise rules are described in Electronic Warehouse Input specifications.

The attribute \texttt{xml:lang} specifies the language in which the article is written (default English, \texttt{en}). See ISO 639 set of entities (p. 178) for an overview of the allowed language codes.

The fixed attribute \texttt{xmlns} sets the default namespace for JA elements, and the other fixed attributes beginning with \texttt{xmlns:} set the prefix and the namespace of elements used in the DTD, e.g. those of the common element pool (\texttt{xmlns:ce}, \texttt{xmlns:sa} and \texttt{xmlns:sb}) and of the XLink standard (\texttt{xmlns:xlink}). Since these attributes are fixed, they need not be specified as they are inferred by the parser.

\texttt{version} is fixed to the first two digits of the version of the DTD.

See \texttt{head} for an example article opening.

\section*{Version history}

In JA DTDs 5.0.1 and 5.0.2, \texttt{xml:lang} could only adopt the values English (\texttt{en}, default) French (\texttt{fr}), German (\texttt{de}), Portuguese (\texttt{pt}), Russian (\texttt{ru}), Spanish (\texttt{es}).

\section*{See also}

\texttt{book-review, exam, simple-article}
body

Declaration

Model (JA DTD 5.0.1–JA DTD 5.2.0)

```xml
<!ELEMENT body ( ce:nomenclature?, ce:salutation?,
              ce:sections, ce:acknowledgment?,
              ce:appendices? )>
```

```xml
<!ATTLIST body
            view %view; 'all'>
```

Description

The element body contains the body of an item.

Usage

The main part of a document is contained in the body, body. It consists of an optional nomenclature (ce:nomenclature), an optional salutation (ce:salutation), a collection of paragraphs, sections, subsections, etc., contained in ce:sections, an optional acknowledgment (ce:acknowledgment), and optional appendices contained in ce:appendices.

Light reading

In HEAD-ONLY, HEAD-AND-TAIL and CONTENTS-ENTRY-ONLY deliveries, the body is not fully captured in XML. Such documents may still have a body, for instance in order to capture electronic components.
book-review

Declaration

Model (JA DTD 5.0.1, JA DTD 5.0.2)

```xml
<!ATTLIST book-review
    xmlns CDATA #FIXED %ESJA.xmlns;
    version CDATA #FIXED '5.0'

    xmlns:xlink CDATA #FIXED %XLINK.xmlns;
    xml:lang %iso639; 'en'
    docsubtype ( brv|err ) "brv">
```

Description

The element `book-review` is used to structure a book review.

Usage

The element `book-review` is one of the top-level elements (doctypes) of the JA DTD. It is used for structuring book reviews.

There are several attributes of the element, as follows.

- The attribute `docsubtype` contains the publication item type (p. 58). The values `brv` and `err` are allowed.
• The attribute `xml:lang` specifies the language in which the article is written (default English, `en`). See ISO 639 set of entities (p. 178) for an overview of the allowed language codes.
• The fixed attribute `xmlns` sets the default namespace for JA elements, and the other fixed attributes beginning with `xmlns:` set the prefix and the namespace of elements used in the DTD, e.g. those of the common element pool (`xmlns:ce` and `xmlns:sb`) and of the XLink standard (`xmlns:xlink`). Since these attributes are fixed, they need not be specified as they are inferred by the parser.
• `version` is fixed to the first two digits of the version of the DTD.

See book-review-head for an example article opening.

Version history

In JA DTDs 5.0.1 and 5.0.2, `xml:lang` could only adopt the values English (`en`, default) French (`fr`), German (`de`), Portuguese (`pt`), Russian (`ru`), Spanish (`es`).

As of JA DTD 5.1.0, the value `err` is allowed for docsubtype.

Description

The element book-review-head contains the head or frontmatter of a book review, structured according to book-review.

Usage

The head of a book review consists of the article footnotes (ce:article-footnote), markers (ce:markers), the document heading (ce:dochead), a label (e.g., “Chapter 7”) (ce:label), the article title (ce:title), a sequence of titles each in an alternative language (ce:alt-title), a list of structured and unstructured bibliographic references, being the books under review (sb:reference and ce:other-ref), the author groups (ce:author-group), the article history (ce:date-received, ce:date-revised, ce:date-accepted) and ce:miscellaneous.

The book-review-head differs from a head in that head’s subtitles have been replaced by information about the book or books under review. Moreover, ce:title is not mandatory; instead, there must be at least a ce:dochead or a ce:title. There is no dedication or presented by, and there are no keywords and (stereochemistry) abstracts.

An example of an opening of a book review is shown in Figs. 2 and 3.
Book review*

Domain theory is the study of certain kinds of mathematical structure, domains, which model notions of approximation in computation. Such structures first arose in the development of denotational semantics of programming languages, where the notion of approximation was crucial for modelling recursion and recursively defined datatypes. From these roots, domain theory has blossomed into an interesting mathematical theory in its own right. Many varieties of domains have been identified and classified, with applications ranging from computation in continuous mathematics to abstract recursion theory.

Other recent textbooks in the area have been primarily concerned with the denotational semantics of programming languages, introducing domain theory as a necessary tool for the provision of such. Mathematical Theory of Domains takes an alternative approach, presenting domain theory very much from a pure mathematical standpoint. This approach is to be applauded. The mathematical theory of domains is more than sufficiently rich to deserve such a presentation, and previous expositions from this viewpoint have appeared only as unpublished notes, or as chapters in handbooks. Therefore, the authors have identified a genuine gap in the market. The question is how well they have filled it.

[...]

In summary, this book tackles the worthy goal of presenting domain theory as an interesting mathematical theory in its own right. Although the presentation is not completely to my taste, the book is well written and does contain a wealth of valuable material, especially in its second half. I would not entirely endorse it as an introductory textbook, but it is highly recommended as a useful and informative addition to any researcher’s bookshelf.

Alex Simpson
University of Edinburgh

*Review copies of books which might be of interest to the readers of Science of Computer Programming should be sent to Prof. K. Apt (address: see inside front cover). Proceedings of conferences will not normally be reviewed.

Figure 2: Example of an article opening (a mocked-up example from which some text has been removed). Its XML coding can be found in Fig. 3.
Version history

Subelement \texttt{ce:markers} was introduced in JA DTD 5.0.2. Subelement \texttt{ce:label} was introduced in JA DTD 5.1.0.

Light reading

The complete head is part of HEAD-ONLY and HEAD-AND-TAIL files. A CONTENTS-ENTRY-ONLY file can only contain \texttt{ce:article-footnote, ce:title} and \texttt{ce:subtitle}, and within \texttt{ce:author-group} only \texttt{ce:author} and \texttt{ce:collaboration}.

**Description**

The element `exam` is used to structure an examination article.

**Usage**

The element `exam` is one of the top-level elements (doctypes) of the JA DTD. It is used for structuring examinations. Examinations, e.g. for continuous medical education (CME), contain questions and answers. They can occur in the `tail` of an `article` but also have an independent existence.
There are several attributes of the element, as follows.

- The mandatory attribute `doctype` contains the publication item type (p. 58). The values `exm` and `err` are allowed.
- The attribute `xml:lang` specifies the language in which the article is written (default English, `en`). See ISO 639 set of entities (p. 178) for an overview of the allowed language codes.
- The fixed attribute `xmlns` sets the default namespace for JA elements, and the other fixed attributes beginning with `xmlns:` set the prefix and the namespace of elements used in the DTD, e.g. those of the common element pool (`xmlns:ce` and `xmlns:sb`) and of the XLink standard (`xmlns:xlink`). Since these attributes are fixed, they need not be specified as they are inferred by the parser.
- `version` is fixed to the first two digits of the version of the DTD.

**Version history**

In JA DTDs 5.0.1 and 5.0.2, `xml:lang` could only adopt the values English (`en`, default) French (`fr`), German (`de`), Portuguese (`pt`), Russian (`ru`), Spanish (`es`).

As of JA DTD 5.1.0, the value `err` is allowed for `doctype`.

ce:presented?, ce:dedication?,
ce:author-group+,
ce:date-received?, ce:date-revised*, ce:date-accepted?,
ce:miscellaneous?, ce:abstract*,
ce:keywords*, ce:stereochem* )>
```

Description

The element head contains the head or frontmatter of an article.

Usage

The head of an article consists of the article footnotes (ce:article-footnote), markers (ce:markers), the document heading (ce:dochead), a label (e.g., “Chapter 7”) (ce:label), the article title and subtitle (ce:title and ce:subtitle), a sequence of titles and subtitles in an alternative language (ce:alt-title and ce:alt-subtitle), presented-by and dedicated-to information (ce:presented and ce:dedication), the author groups (ce:author-group), article history (ce:date-received, ce:date-revised, ce:date-accepted and ce:miscellaneous) abstracts of various classes, each in several possible languages (ce:abstract), keywords and classification codes (ce:keywords), stereochemistry abstracts (ce:stereochem).

An example of an article opening is shown in Figs. 4 and 5.

The head differs from a simple-head in that the title (ce:title) and the author group (ce:author-group) are mandatory.
Version history

Subelement `ce:markers` was introduced in JA DTD 5.0.2. Subelement `ce:label` was introduced in JA DTD 5.1.0.

Light reading

The complete head is part of HEAD-ONLY and HEAD-AND-TAIL files. A CONTENTS-ENTRY-ONLY file can only contain `ce:article-footnote, ce:title, and ce:subtitle`, and within `ce:author-group` only `ce:author` and `ce:collaboration`.

Electroforming of 3D microstructures on highly structured surfaces

L.S. Johansen, M. Ginnerup, P.T. Tang, B. Löchel

Abstract

Electrodeposition of photoresist on highly structured surfaces is combined with electroplating to fabricate three new types of advanced 3D metal microstructures. In one application, electroplated nickel cantilever arrays are formed on the sloped sidewalls of KOH etched silicon. The cantilevers are released by sacrificial etching of copper. In another application it is shown how KOH etched silicon V-grooves can be patterned by electrochemically deposited photoresist to generate versatile 3D electroforming moulds. To demonstrate the potential of this technology, an innovative all-nickel cantilever structure with V-shaped cross section and integrated reflection mirror for optical readout has been fabricated. Cantilevers with V-cross section can be designed to have significantly larger out of plane bending stiffness or higher resonant frequency compared to rectangular cantilevers with similar dimensions. A third application uses electrodedeposited photoresist to fabricate copper sierdoms on an oxidised silicon support. © 2000 Elsevier Science S.A. All rights reserved.

Keywords: Electroplating; Electrodeposited photoresist; 3D fabrication; Cantilevers; Micromolds

I. Introduction

Conventional photoresist spin coating is an inherently planar technology and does not allow for conformal coating of highly structured surfaces. The advent of electrodeposited (ED) photoresists has made such conformal coatings possible. Due to the self-stopping deposition chemistry, ED resist can coat very uneven surfaces with a uniform layer thickness. The as-deposited resist film has a low water content and therefore only a small tendency to flow. Exposure can be carried out using standard UV mask aligners. Recently, X-ray exposure has also been employed, yielding very high pattern resolution at large mask gaps [1].

The above mentioned advantages of conformal coating have already resulted in a number of MEMS applications such as wafer feed-through leads [2,3], acoustic hole formation on the bottom of a KOH etched back plate for a condenser microphone [4], and patterning of 45° angled silicon mirrors [5]. The major drawback of ED resist is that only conducting surfaces can be coated. This might render it useless for applications where a conductive layer can not be applied. In electroplating processes however, a conductive seed layer is already present, and ED resist can easily be adapted as a plating mould. Since both electrodeposition and electroplating processes have the ability of covering complex topographies, a combination of these has great potential and has not yet been fully explored.

This paper presents three different demonstrations of how electrodeposition of photoresist on highly structured surfaces can be combined with electroplating to form new advanced metallic 3D structures. Hitherto, no releasing of microstructures defined by ED resist has been performed. Two of the demonstrations therefore show how novel releasable nickel cantilevers can be electroformed using ED photoresist moulds on non-planar surfaces, thus adding a new degree of freedom to microsystem design. The third application demonstrates an alternative fabrication of microcavities, made possible by ED moulds. All three

Figure 4: Example of an article opening. Its XML coding can be found in Fig. 5.

item-info

Declaration

Model (JA DTD 5.0.1–JA DTD 5.1.0)

```xml
<!ELEMENT item-info ( jid, aid?, ce:pii, ce:doi?,
                     ce:document-thread?, ce:copyright,
                     ce:doctopics?, ce:preprint? )>
```

Model (JA DTD 5.2.0)

```xml
<!ELEMENT item-info ( jid, aid?, ce:pii, ce:doi?,
                     ce:document-thread?, %copyright;,
                     ce:doctopics?, ce:preprint? )>
```

Description

The element `item-info` contains information about the article.

Usage

Item information is contained within `item-info`. The Elsevier system code and article number are present in `jid` and `aid`. This is followed by the PII and optionally the DOI, `ce:pii` and `ce:doi`. The DOI is not always present, since it may be assigned only to items that will be published online.

A relationship with other articles can be made using `ce:document-thread`, e.g. to link an erratum to the original article or to create a discussion thread.

The mandatory `ce:copyright` contains the copyright owner and status of the item. It is followed by `ce:copyright-line` that contains the complete copyright line, which can be used verbatim in rendering. The latter element is optional for backward compatibility reasons, but it is required to be present.

The `ce:doctopics` can be used to place the article in a topic hierarchy.

Finally, the subelement `ce:preprint` is to link the item with a preprint of the article residing on a preprint server.

For more information, see the subelements.

XML

```xml
<Item-info>
  <jid>IPL</jid>
  <aid>4702</aid>
  <ce:pii>S0020-0190(12)00057-9</ce:pii>
  <ce:doi>10.1016/j.ipl.2012.02.008</ce:doi>
  <ce:copyright type="full-transfer"
               year="2012">Elsevier B.V.</ce:copyright>
  <ce:copyright-line>
    &copy; 2012 Elsevier B.V.
    All rights reserved.
  </ce:copyright-line>
</Item-info>
```

Version history

In JA DTD 5.2.0 the `ce:copyright` element was replaced by the `%copyright;` entity. This entity contains the `ce:copyright-line` element.

Description

The element simple-article is used to structure a simple article.

Usage

The element simple-article is one of the top-level elements (doctypes) of the JA DTD. It is used for structuring “simple” articles, such as editorials, obituaries, prefaces, etc. Ironically, simple articles are more complicated in an XML sense, since enforcing strict rules is not always possible due to the great variety of appearances of these articles.

Note that even a full-length article might be structured as a simple article, e.g. when it is delivered as CONTENTS-ENTRY-ONLY.
There are several attributes of the element, as follows.

- The attribute `docsubtype` is the most important one. It is mandatory; its complete list of values is described in the section Publication item types (p. 58).
- The attribute `xml:lang` specifies the language in which the article is written (default English, `en`). See ISO 639 set of entities (p. 178) for an overview of the allowed language codes.
- The fixed attribute `xmlns` sets the default namespace for JA elements, and the other fixed attributes beginning with `xmlns:` set the prefix and the namespace of elements used in the DTD, e.g. those of the common element pool (`xmlns:ce` and `xmlns:sb`) and of the XLink standard (`xmlns:xlink`). Since these attributes are fixed, they need not be specified as they are inferred by the parser.
- `version` is fixed to the first two digits of the version of the DTD.

**Version history**

In JA DTDs 5.0.1 and 5.0.2, `xml:lang` could only adopt the values English (`en`, default), French (`fr`), German (`de`), Portuguese (`pt`), Russian (`ru`), Spanish (`es`).

  ce:date-revised*, ce:date-accepted?,
  ce:miscellaneous?, ce:abstract*,
  ce:keywords* )>
```

Model (JA DTD 5.1.0, JA DTD 5.2.0)

```xml
<!ELEMENT simple-head ( ce:article-footnote*, ce:markers?,
  ( ( ce:label?, ce:title ) | ( ce:dochead, ce:title? ) ),
  ce:subtitle?, ( ce:alt-title, ce:alt-subtitle? )*,
  ce:author-group*,
  ce:date-received?, ce:date-revised*,
  ce:date-accepted?, ce:miscellaneous?,
  ce:abstract*, ce:keywords* )>
```

Description

The element `simple-head` contains the head or frontmatter of a “simple” article or an examination item, `simple-article` or `exam`.

Usage

The head of a simple article consists of the article footnotes (`ce:article-footnote`), markers (`ce:markers`), the document heading (`ce:dochead`), a label (e.g., “Chapter 7”) (`ce:label`), the article title and subtitle (`ce:title, ce:subtitle`), a sequence of titles and subtitles in an alternative language (`ce:alt-title and ce:alt-subtitle`), the author groups (`ce:author-group`), article history (`ce:date-received, ce:date-revised, ce:date-accepted` and `ce:miscellaneous`) abstracts of various classes, each in several possible languages (`ce:abstract`), keywords and classification codes (`ce:keywords`).

The `simple-head` differs from a `head` in that the title (`ce:title`) is mandatory in a head, whereas in a simple head there is at least a `ce:dochead` or a title; the author group (`ce:author-group`) is mandatory in a head; and in a simple head there is no presented by or dedicated to information and there are no stereochemistry abstracts.
Version history

Subelement `ce:markers` was introduced in JA DTD 5.0.2. Subelement `ce:label` was introduced in JA DTD 5.1.0.

Light reading

The complete head is part of HEAD-ONLY and HEAD-AND-TAIL files. A CONTENTS-ENTRY-ONLY file can only contain `ce:article-footnote`, `ce:title` and `ce:subtitle`, and within `ce:author-group` only `ce:author` and `ce:collaboration`.

<!ELEMENT simple-tail ( ce:bibliography?, ce:further-reading?,
            ce:glossary?, ce:biography* )>
<!ATTLIST simple-tail view %view; 'all'>
```

Description

The element `simple-tail` contains the tail of a simple article or book review.

Usage

The tail of a simple article or a book review is contained within `simple-tail`. This element consists of four subelements: an optional `ce:bibliography` (containing the bibliographic references) and an optional `ce:further-reading` (containing the further-reading list), a glossary (`ce:glossary`) and a number of biographies of the authors (`ce:biography`).

Version history

The subelements `ce:glossary` and `ce:biography` were added in JA DTD 5.1.0.

tail

Declaration

Model (JA DTD 5.0.1–JA DTD 5.2.0)

```xml
<!ELEMENT tail ( ce:bibliography?, ce:further-reading?, ce:glossary?, ce:biography*,
                ( ce:exam-answers | ce:exam-questions | ce:exam-reference )* )>
<!ATTLIST tail
  view %view; 'all'>
```

Description

The element `tail` contains the tail of an article.

Usage

The tail of an article or a book review is contained within `tail`. None of its constituents are mandatory, but the element must not be empty.

The tail consists of the bibliographic references (`ce:bibliography`), a further-reading list (`ce:further-reading`), a glossary (`ce:glossary`), a number of biographies of the authors (`ce:biography`), followed by a sequence of examination questions and answers, and references to earlier examinations (`ce:exam-questions, ce:exam-answers, ce:exam-reference`). For more information, see these elements.

Chapter 4

Serial Issue DTD

This chapter contains an alphabetic listing of the elements in the serial issue DTD, SI DTD. This DTD is used for defining journal issues and book series volumes, i.e., it captures the exact composition of the issue in the form of pointers to the individual items, and it captures the issue’s properties such as title, (guest) editors, cover date, etc. A document structured with the SI DTD is often called an issue hub.

The serial issue DTD defines one top-level element: serial-issue.

CEP version used in this DTD

Two serial issue DTDs are described in this documentation. DTD 5.1.0 uses the common element pool version 1.1.3, while DTD 5.2.0 uses the common element pool version 1.2.0.
**abbr-name**

**Declaration**

**Model (SI DTD 5.1, SI DTD 5.2)**

```xml
<!ELEMENT abbr-name ( %richstring.data; )*>
```

**Description**

The element *abbr-name* contains the official abbreviated name of a conference.

**Usage**

See *conference-info*. 
conference-info

Declaration

Model (SI DTD 5.1, SI DTD 5.2)

<!ELEMENT conference-info ( full-name?, abbr-name?, venue?,
  date-range? )>

Description

The element conference-info contains information about a conference.

Usage

Issues can be related to a conference or contain the proceedings of a conference. In that case, information about the conference is captured with conference-info.

The full-name contains the full name of the conference if it is different from the title of the issue. Often, a conference also has an commonly known abbreviated name, abbr-name. The location where the conference took place is captured with venue. A subelement date-range is provided for the date or date range when the conference took place. The four subelements are optional, but conference-info must not be empty.

XML

<conference-info>

  </date-range>
</conference-info>

See also

date-range
Chapter 4 – Serial Issue DTD

cover-date

Declaration

Model (SI DTD 5.1, SI DTD 5.2)

<!ELEMENT cover-date ( date-range )>

Description

The element cover-date contains the cover date of the issue.

Usage

The cover date of the issue is contained within cover-date in the form of a date-range. It is not always clear for each publication what the cover date is. Some serial publications do not carry a cover date on the cover of their printed issues. ScienceDirect®, however, displays the cover date prominently with each issue in the issue list for each journal or book series, and uses it to determine the publication year when it generates the bibliographic data for the items in the issue. For lack of a more precise definition, the date displayed there is the cover date contained in this element.
cover-image

Declaration

Model (SI DTD 5.1, SI DTD 5.2)

<!ELEMENT cover-image (ce:figure )>

Description

The element cover-image contains the cover image of a serial issue.

Usage

Cover images are captured with the element cover-image.

Structurally, the cover image is associated with the issue using the ce:figure, which in this case may not be nested within itself. The ce:link element provides the link to the cover image file. An optional caption explaining the featured cover image, copyright information, etc., can be added, using the features of ce:figure.

XML

<cover-image>
  <ce:figure>
    <ce:label>Functional Specificity of Small GTPases</ce:label>
    <ce:caption>
      <ce:simple-para>The cover shows eight of the distinct cell morphology classes that were induced by expression of constitutively active Ras superfamily small GTPases. ce:figure
date-range

Declaration
Model (SI DTD 5.1, SI DTD 5.2)
<!ELEMENT date-range ( start-date, end-date? )>

Description
The element date-range contains the date range in EFFECT date format.

Usage
The element date-range consists of a start-date and an optional end-date, both in EFFECT format.

The EFFECT date format has one of three EFFECT date forms.
- YYYY, denoting a year.
- YYYYMM, where YYYY is a year, and MM is a month, season or quarter. If MM ranges between 01 and 12, then it denotes a month (January to December). If MM ranges between 21 and 24, then it denotes a season (21: Spring, 22: Summer, 23: Autumn, 24: Winter). If MM ranges between 31 and 34, then it denotes a quarter (31: 1st Quarter, 32: 2nd Quarter, 33: 3rd Quarter, 34: 4th Quarter).
- YYYYMMDD, denoting a day.

The end-date must be of the same EFFECT date form as the start-date.

There is also an EFFECT date range format, containing a slash. This must not be used.

editors

Declaration

Model (SI DTD 5.1, SI DTD 5.2)
<!ELEMENT editors ( %richstring.data; )*>

Description

The element editors contains the names of the (guest) editors of a serial issue in an unstructured format.

Usage

See title-editors-group.

XML

<editors>P. Johnson and K.S. Agarwal</editors>

This element is provided for backward compatibility with the EFFECT dataset.toc dataset description file.
end-date

Declaration

Model (SI DTD 5.1, SI DTD 5.2)
<!ELEMENT end-date (%string.data; )*>  

Description

The element end-date contains the end date of a date range in EFFECT format.

Usage

See date-range.
full-name

Declaration

Model (SI DTD 5.1, SI DTD 5.2)
<!ELEMENT full-name ( %richstring.data; )*>

Description

The element full-name contains the full name of a conference if it is different from the issue title.

Usage

See conference-info.
iss-first

Declaration

Model (SI DTD 5.1, SI DTD 5.2)

<!ELEMENT iss-first ( %string.data; )*>

Description

The element iss-first contains the issue number, or the first issue number in an issue number range, of a serial issue.

Usage

See volume-issue-number.
iss-last

Declaration

Model (SI DTD 5.1, SI DTD 5.2)
<!ELEMENT iss-last ( %string.data; )*>

Description

The element iss-last contains the last issue number in an issue number range of a serial issue.

Usage

See volume-issue-number.
issue-body

Declaration

Model (SI DTD 5.1, SI DTD 5.2)

```xml
<!ELEMENT issue-body ( ( ce:include-item | issue-sec )+ )>
```

Description

The element `issue-body` provides the link between the issue and the items in that issue. It is both a "hub" and the source for the table of contents.

Usage

The issue body consist of all items that belong to the issue. These items are referred to via the generic `ce:include-item` element. Thus it acts as hub for the whole issue, but it also acts as the table of contents of the issue. The items can be grouped in sections, `issue-sec`, that must have a section title. These sections can be nested. In this way, second-, third- and fourth-order headings within the table of contents are supported. Headings of higher order than that, though possible according to the DTD, are not allowed. In files structured according to the SI DTD, the title subelements of `ce:include-item` are not used.

XML

```xml
<issue-body>
  <issue-sec id="is1">
    <ce:section-title>Nuclear Structure and Dynamics</ce:section-title>
    <ce:include-item>
      <ce:pii>S0375-9474(02)01400-8</ce:pii>
      <ce:doi>10.1016/S0375-9474(02)01400-8</ce:doi>
      <ce:pages>
        <ce:first-page>355</ce:first-page>
        <ce:last-page>390</ce:last-page>
      </ce:pages>
    </ce:include-item>
    ...
    <ce:include-item>
      <ce:pii>S0375-9474(02)01372-6</ce:pii>
      <ce:doi>10.1016/S0375-9474(02)01372-6</ce:doi>
      <ce:pages>
        <ce:first-page>463</ce:first-page>
        <ce:last-page>477</ce:last-page>
      </ce:pages>
    </ce:include-item>
  </issue-sec>

  <issue-sec id="is2">
    <ce:section-title>Hadronic Physics</ce:section-title>
    <ce:include-item>
      <ce:pii>S0375-9474(02)01371-4</ce:pii>
      <ce:doi>10.1016/S0375-9474(02)01371-4</ce:doi>
      <ce:pages>
        <ce:first-page>481</ce:first-page>
      </ce:pages>
    </ce:include-item>
  </issue-sec>
</issue-body>
```
Presentation

Nuclear Structure and Dynamics
Nuclear structure of $^{126}$Te studied with the $(n, \gamma)$ reaction

... M. Sambataro
RPA-like calculations within limited particle–hole spaces

Hadronic Physics
F. Neumann, M. Buballa and M. Oertel
Mixed phases of color superconducting quark matter

... M.P. Rekalo and E. Tomasi-Gustafsson
Determination of the $g_{\text{V}\gamma}$ coupling constant through the process $\gamma + N \rightarrow N + V$ with circularly polarized photons

Intermediate and High Energy Heavy Ion Physics
C. Fuchs and T. Gaitanos
Consequences of kinetic non-equilibrium for the nuclear equation-of-state in heavy ion collision

Nuclear Astrophysics
E. Holmlund and J. Suhonen
Microscopic nuclear structure calculations for the solar-neutrino detector $^{71}$Ga and close-lying isobars

Errata
H. Nakada and M. Sato

Cumulative author index

Add-on items, short commentaries that follow an item, are included with `ce:include-items`. The main item does not possess a role attribute. The add-on items have the role attribute set to add-on.

The element `ce:include-item` possesses a view attribute. This can be used to include different items depending on the view. See the section on Views.

If an item comprises just one page, the `ce:last-page` is not present.

Rendering notes

It can happen that an issue-sec is not followed by another issue-sec but by further ce:include-items. In the example given above, this is the case for the “Cumulative author index” at the end of the issue. Visual separation is required in order to prevent the impression that the item belongs to be preceding issue-sec.
issue-data

Declaration

Model (SI DTD 5.1, SI DTD 5.2)

<!ELEMENT issue-data ( cover-date, ce:pages+, cover-image?, issue-designation?, title-editors-group* )>

Description

The element issue-data contains the data belonging to the issue itself.

Usage

The element issue-data consists of cover-date, the mandatory cover date; ce:pages, a series of one or more page ranges, detailing the page ranges that occur in the issue; cover-image, an optional image of the (paper) issue’s cover; issue-designation, an optional subtitle or section of the serial publication; and optional title, editors, conference information, etc., in title-editors-group.

The page ranges of the issue, captured with a series of ce:pages, include only the “interior” page ranges of the serial issue, unless front- or backmatter ranges are of great importance.

XML

<ce:pages>
  <ce:first-page>1</ce:first-page>
  <ce:last-page>300</ce:last-page>
</ce:pages>

<ce:pages>
  <ce:first-page>L1</ce:first-page>
  <ce:last-page>L38</ce:last-page>
</ce:pages>

Presentation

Possible rendering: Pages 1–300, L1–L38

A journal issue or book series volume can be associated with more than one conference, e.g. two thin special issues in one issue. For this reason there can be more than one title-editors-group. It is, however, impossible to indicate which items in the serial issue are associated with which title and editors group — this can only be made clear by using meaningful issue-secs.

For more information about the remaining subelements of issue-data, see these subelements.
issue-designation

Declaration

Model (SI DTD 5.1, SI DTD 5.2)
<!ELEMENT issue-designation ( %richstring.data; )*>

Description

The element issue-designation contains a subtitle or section of the serial publication to which the issue belongs.

Usage

For some publications, the issues belong to a certain section or “sub-journal” or “sub-series”. The element issue-designation can be used to store that information.

XML

<issue-designation>Logic, semantics and theory of programming</issue-designation>

XML

<issue-designation>Field Theory and Statistical Systems</issue-designation>

Explanation

The issues of the journal Theoretical Computer Science carry a subtitle “Algorithms, complexity and games” or “Logic, semantics and theory of programming”. The issues of the journal Nuclear Physics B carry a subtitle “Field Theory and Statistical Systems”, “Physical Mathematics” or “Particle Physics”. This is the way to capture that property of the issue.
issue-info

Declaration

Model (SI DTD 5.1, SI DTD 5.2)

```
<!ELEMENT issue-info (ce:pii, ce:doi?, jid, ce:issn,
volume-issue-number, ce:isbn?)>
```

Description

The element `issue-info` contains the identifiers that uniquely identify the issue.

Usage

An issue in a serial publication has several equivalent identifiers that can be used to retrieve the issue.

An issue has its own “publishable item identifier”, PII, stored within `ce:pii`. An optional digital object identifier, DOI can also be assigned to the issue, `ce:doi`. The issue PII may have an “X” in the first position of the five-digit component.

An alternative form of issue identification is by the Elsevier internal system code, called JID (an abbreviation of journal ID) and volume/issue number. The serial publication is identified in two ways: by code, `jid` and by the ISSN, `ce:issn`. In view of publication evolution and the importance of correctly assigning an issue to a publication, both are present. The volume/issue number is captured using the subelement `volume-issue-number`.

Finally, some serial publications assign ISBNs to their volumes or issues, e.g. in the case of all book series. The optional `ce:isbn` is used to store the ISBN.

XML

```
<issue-info>
  <ce:pii>S9999-9994(03)X7607-2</ce:pii>
  <jid>ENDEND</jid>
  <ce:issn>9999-9994</ce:issn>
  <volume-issue-number>
    <vol-first>31</vol-first>
    <iss-first>5</iss-first>
  </volume-issue-number>
</issue-info>
```
### issue-sec

#### Declaration

**Model (SI DTD 5.1)**

```xml
<!ELEMENT issue-sec (ce:section-title?, (ce:include-item | issue-sec)+ )>
<!ATTLIST issue-sec
  id ID #IMPLIED
  role CDATA #IMPLIED>
```

**Model (SI DTD 5.2)**

```xml
<!ELEMENT issue-sec (ce:section-title?, (ce:include-item | issue-sec)+ )>
<!ATTLIST issue-sec
  id ID #IMPLIED
  role CDATA #IMPLIED
  group-id IDREF #IMPLIED>
```

#### Description

The element `issue-sec` is used to group items within the issue under a common heading.

#### Usage

Many issues contain a hierarchical structure of their items. This structure usually reveals itself in the table of contents, that may contain first-order headings or higher-order headings. This grouping of items is accomplished using the element `issue-sec`. It consists of a `ce:section-title` containing the heading, a number of included items and/or nested item sections.

An issue can contain one or more “special issues”. Additional properties of such an issue are captured in `title-editors-group`. The items in such an issue should be placed in an `issue-sec` which can then refer to a `title-editors-group` by means of its attribute `group-id`.

**XML**

```xml
<serial-issue>
  <issue-info>...</issue-info>
  <issue-data>
    ...
    <title-editors-group id="teg1">
      <ce:title id="t1">Fourth International Conference on Business Process Management (BPM 2006)</ce:title>
      <ce:subtitle>Four selected and extended papers</ce:subtitle>
      <ce:editors>...</ce:editors>
    </title-editors-group>
    <title-editors-group id="teg2">
      <ce:title id="t2">8th International Conference on Enterprise Information Systems (ICEIS' 2006)</ce:title>
      <ce:subtitle>Three selected and extended papers</ce:subtitle>
      <ce:editors>...</ce:editors>
    </title-editors-group>
  </issue-data>
</serial-issue>
```
Although \texttt{ce:section-title} is declared optional in the DTD, it must always be present. For more information, see \texttt{issue-body}.

**Version history**

The \texttt{group-id} attribute was added in version 5.2.0 of the DTD.
**jid**

**Declaration**

Model (SI DTD 5.1, SI DTD 5.2)

```xml
<!ELEMENT jid ( %string.data; )*>
```

**Description**

The element `jid` contains the Elsevier system code of the serial publication.

**See also**

`ce:pii`, `ce:doi`
serial-issue

Declaration

Model (SI DTD 5.1)

```xml
<!ELEMENT serial-issue ( issue-info, issue-data, issue-body )>
<!ATTLIST serial-issue
  xmlns CDATA #FIXED %ESSI.xmlns;
  version CDATA #FIXED '5.1'
  xmlns:ce CDATA #FIXED %ESCE.xmlns;
  xmlns:sb CDATA #FIXED %ESSB.xmlns;
  xmlns:xlink CDATA #FIXED %XLINK.xmlns;
  xml:lang %language; 'en'>
```

Model (SI DTD 5.2)

```xml
<!ELEMENT serial-issue ( issue-info, issue-data, issue-body )>
<!ATTLIST serial-issue
  xmlns CDATA #FIXED %ESSI.xmlns;
  version CDATA #FIXED '5.2'
  xmlns:ce CDATA #FIXED %ESCE.xmlns;
  xmlns:sb CDATA #FIXED %ESSB.xmlns;
  xmlns:xlink CDATA #FIXED %XLINK.xmlns;
  xml:lang %iso639; 'en'>
```

Description

The element `serial-issue` contains a serial issue.

Usage

The element `serial-issue` is the top-level element (single doctype) of the SI DTD. It is used for structuring serial issues. It captures the data of the issue, and acts as a “hub” for the items in the issue.

There are several attributes of the element, as follows.

- The attribute `xml:lang` specifies the language in which the issue hub is written (default English, en). See ISO 639 set of entities (p. 178) for an overview of the allowed language codes.
- The fixed attribute `xmlns` sets the default namespace for SI elements, and the other fixed attributes beginning with `xmlns:` set the prefix and the namespace of elements used in the DTD, e.g. those of the common element pool (`xmlns:ce` and `xmlns:sb`) and of the XLink standard (`xmlns:xlink`). Since these attributes are fixed, they need not be specified as they are inferred by the parser.
- `version` is fixed to 5.2, i.e. the first two digits of the version of the DTD.

Figures 6 and 7 on the following pages show an example of a serial issue.

On the cover: The cover shows eight of the distinct cell morphology classes that were induced by expression of constitutively active Ras superfamily small GTPases. NIH3T3 fibroblasts were transfected with 100 different mutant small GTPases and the observed morphologies were grouped into different classes. The cell in the middle is a cell transfected with a control construct. For further information, please see the article by Heo and Meyer in this issue (pp. 369-381).

Chapter 4 – Serial Issue DTD

sponsor

Declaration

Model (SI DTD 5.1)
<!ELEMENT sponsor ( %richstring.data; )*>

Model (SI DTD 5.2)
<!ELEMENT sponsor ( %richstring.data; )*>
<!ATTLIST sponsor id ID #IMPLIED>

Description

The element sponsor contains sponsor text for a conference.

Usage

See sponsors.

Version history

The id attribute was added in version 5.2.0 of the DTD.
**sponsors**

**Declaration**

**Model (SI DTD 5.1, SI DTD 5.2)**

```xml
<!ELEMENT sponsors ( sponsor+ )>
```

**Description**

The element `sponsors` contains information about one or more sponsors of a conference or sponsors of the serial issue.

**Usage**

When a conference or a journal issue or book series volume is sponsored, the element `sponsors` is used to capture this information.

The element `sponsor` does not generate any text itself, therefore the full “sponsored by” text is captured within `sponsor`.

**XML**

```xml
<sponsors>
  <sponsor id="sp1">Sponsored by Reckitt Benckiser Pharmaceuticals</sponsor>
</sponsors>
```

**XML**

```xml
<sponsors>
  <sponsor id="sp2">Sponsored by Reckitt Benckiser Pharmaceuticals and GlaxoSmithKline</sponsor>
</sponsors>
```

**XML**

```xml
<sponsors>
  <sponsor id="sp3">This issue was partially funded by a grant from the Clay Mathematics Institute</sponsor>
</sponsors>
```

The second example shows that it is possible to have two sponsors within `sponsor`. If there is the need to have more than one sponsor text it is possible to use more `sponsor` elements. Examples of this are sponsor texts in different languages or texts of a different nature that one would like to separate.

**XML**

```xml
<sponsors>
  <sponsor id="sp4">Sponsored by Reckitt Benckiser Pharmaceuticals</sponsor>
  <sponsor id="sp5">The conference was made possible by a grant from the National Science Foundation</sponsor>
</sponsors>
```

**XML**

```xml
<sponsors>
  <sponsor id="sp6">Sponsored by Reckitt Benckiser Pharmaceuticals</sponsor>
  <sponsor id="sp7">Gesponsort durch Reckitt Benckiser Pharmaceuticals</sponsor>
</sponsors>
```
Chapter 4 – Serial Issue DTD

**start-date**

**Declaration**

**Model (SI DTD 5.1, SI DTD 5.2)**

```xml
<!ELEMENT start-date ( %string.data; )*>
```

**Description**

The element `start-date` contains the start date of a date range in EFFECT format.

**Usage**

See `date-range`. 
suppl

Declaration

Model (SI DTD 5.1, SI DTD 5.2)
<!ELEMENT suppl ( %string.data; )*>*

Description

The element suppl contains the supplementary designation within the volume/issue number of the journal issue, for supplements, parts and indexes.

Usage

See volume-issue-number.
title-editors-group

Declaration

Model (SI DTD 5.1)

```xml
<!ELEMENT title-editors-group ( ( %titles; )?, conference-info?, ( editors | ce:editors )?, sponsors? )>
```

Model (SI DTD 5.2)

```xml
<!ELEMENT title-editors-group ( ( %titles; )?, conference-info?, ( editors | ce:editors )?, sponsors? )>
<!ATTLIST title-editors-group id ID #IMPLIED>
```

Description

The element `title-editors-group` contains information belonging to a serial issue.

Usage

The element `title-editors-group` contains information about the serial issue, such as its title, its editors, etc.

Journal issues are either “regular” or “special”. Special issues also include proceedings and thematical or topical issues. They have additional properties above those of a regular issue. In particular, they may possess a title, (guest) editors, and can belong to a conference.

A volume in a book series can also have one or more of these properties.

The element `title-editors-group` is provided for capturing the above-mentioned properties of a serial issue. An issue can have zero or more of these elements. If it has none, then the issue must be regular. If it has more than one, then it indicates that the issue in fact contains more than one “special issue”. The items in such a “special issue” should be placed in an `issue-sec` which can then refer to a `title-editors-group` by means of its attribute `group-id`. See `issue-sec` for an example.

The title of the serial issue can be captured with `ce:title`. In addition to the title, there can optionally be a subtitle (`ce:subtitle`), titles in an alternative language (`ce:alt-title`), and subtitles in an alternative language (`ce:alt-subtitle`).

If the serial issue is related to a conference, then the details of that conference is contained in `conference-info`.

Serial issues may have (guest) editors. These can be captured in two alternative ways. One is in the form of an unstructured string of names (`editors`), the other is a structured list of editors (`ce:editors`, for more information see the description of that element). These (guest) editors should not be confused with the Editorial Board members. Those are captured in a separate document with `doctype` equal to `edb`.

One or more sponsors can be associated with the issue (or with the conference). These are captured within `sponsors`.

Element editors is provided for backward compatibility with the EFFECT dataset.toc dataset description file.

Version history

The id attribute was added in version 5.2.0 of the DTD.
venue

Declaration
Model (SI DTD 5.1, SI DTD 5.2)
<!ELEMENT venue ( %richstring.data; )*>

Description
The element venue contains the location where the conference took place.

Usage
See conference-info.
vol-first

Declaration

Model (SI DTD 5.1, SI DTD 5.2)

<!ELEMENT vol-first ( %string.data; )*>

Description

The element **vol-first** contains the volume number, or the first volume in a volume number range, of a serial issue.

Usage

See **volume-issue-number**.
vol-last

Declaration

Model (SI DTD 5.1, SI DTD 5.2)
<!ELEMENT vol-last ( %string.data; )*>

Description

The element vol-last contains the last volume in a volume number range of a serial issue.

Usage

See volume-issue-number.
volume-issue-number

Declaration

Model (SI DTD 5.1, SI DTD 5.2)

```xml
<!ELEMENT volume-issue-number ( vol-first, ( ( vol-last, suppl ) | ( iss-first, iss-last?, suppl? ) | suppl ) )>
```

Description

The element `volume-issue-number` contains the volume/issue number of the issue.

Usage

Each issue has a “volume/issue number”, which can be broken into different parts: the volume or volume range, the issue or issue range, and the supplementary information. This is captured in up to five elements, `vol-first`, `vol-last`, `iss-first`, `iss-last`, `suppl`.

The `suppl` element may only contain the following:

- C, for “complete”
- P, for “part”, optionally followed by a single digit or a capital letter
- I, for “index”, optionally followed by a single or a double digit number or a capital letter
- S, for “supplement”, optionally followed by a single or a double digit number or a capital letter

In the case of a P100 delivery the `suppl` element may also contain an F, for “spin-off”, optionally followed by a single digit, or one of the above options followed by F optionally followed by a single digit.

```xml
<volume-issue-number>
  <vol-first>4</vol-first>
  <iss-first>4</iss-first>
</volume-issue-number>

<volume-issue-number>
  <vol-first>192</vol-first>
  <iss-first>1</iss-first>
  <iss-last>3</iss-last>
</volume-issue-number>

<volume-issue-number>
  <vol-first>227</vol-first>
  <vol-last>228</vol-last>
  <suppl>C</suppl>
</volume-issue-number>

<volume-issue-number>
  <vol-first>50</vol-first>
  <suppl>I</suppl>
</volume-issue-number>
```
Presentation

4/4
192/1–3
227–228
Vol. 50, Master Index
Vol. 73, Supplement 1
Vols. 42–45, Part B
This chapter contains an alphabetic listing of the elements in the Elsevier Book DTD and its predecessor, the Elsevier Health Sciences Book DTD. This DTD has the following top-level elements: book, chapter, simple-chapter, examination, fb-non-chapter, glossary, index, introduction, bibliography. These top-level elements provide the option to define the structure of the book (book) and the content of the book (the other top-level elements). The former contains metadata and hierarchy of the book project, and it “calls” the chapters, the index, etc. using the ce:include-item element. This is why it is often referred to as the “hub” of the book.

In serial publications, items and issue hubs are structured with two different DTDs, the JA DTD and the SI DTD. This is due to historical reasons. In the Elsevier Book DTD, all aspects of a book are supported.

**CEP version used in this DTD**

The Book DTD versions described in this documentation make use of different versions of the common element pool, as follows:

<table>
<thead>
<tr>
<th>Book DTD</th>
<th>Common element pool</th>
</tr>
</thead>
<tbody>
<tr>
<td>EHS Book DTD 5.1.0</td>
<td>CEP 1.1.2</td>
</tr>
<tr>
<td>EHS Book DTD 5.1.1</td>
<td>CEP 1.1.3</td>
</tr>
<tr>
<td>Book DTD 5.2.0</td>
<td>CEP 1.1.3</td>
</tr>
<tr>
<td>Book DTD 5.2.1</td>
<td>CEP 1.1.3</td>
</tr>
<tr>
<td>Book DTD 5.3.0</td>
<td>CEP 1.1.6</td>
</tr>
<tr>
<td>Book DTD 5.3.1</td>
<td>CEP 1.1.6</td>
</tr>
</tbody>
</table>

**Parameter entities**

The Book DTDs use the local parameter entities %local.spar.data; and %local.par.data; to add element ce:index-flag to parameter entities %spar.data; and %par.data;.

The effect is that ce:index-flag can be used in any element that has %spar.data; or %par.data; in its model. In the same way it adds ce:br to parameter entity %textfn.data;.

```xml
<!ENTITY % local.spar.data "| ce:index-flag">
<!ENTITY % local.par.data "| ce:index-flag">
<!ENTITY % local.textfn.data "| ce:br">
```

  docsubtype %docsubtype; #FIXED "bib">
```

Description

The element bibliography is used to capture book-level bibliographies that sometimes appear in a book’s back matter.

Usage

The bibliography element is used to capture a book-level bibliography when they appear in the back matter of a book. When used, bibliography will always appear as a top-level element, with its own DOCTYPE declaration/PUBLIC identifier appearing at the top of the XML file. A bibliography gets called into the book’s hub XML file by a ce:include-item element.
Content for bibliography consists of required info followed by optional ce:label, optional ce:title, and optional/repeatable ce:further-reading.

It has an optional role, along with several required attributes:

- version 5.3
- xmlns:ce http://www.elsevier.com/xml/common/dtd
- xmlns:xlink http://www.w3.org/1999/xlink
- xml:lang en
- id
- docsubtype bib.

**XML**

```xml
<!DOCTYPE bibliography PUBLIC "-//ES//DTD book DTD version 5.3.0//EN//XML" "book530.dtd" []>
<bibliography docsubtype="bib" id="bibliog">
  <info>
    <ce:pii>B978-0-323-01679-7.10003-8</ce:pii>
    <ce:isbn>978-0-323-01679-7</ce:isbn>
    <ce:copyright type="full-transfer" year="2003">Mosby, Inc.</ce:copyright>
  </info>
  <ce:title id="ttl1">Bibliography</ce:title>
  <ce:further-reading id="fr1">...
</ce:further-reading>
</bibliography>
```

**Version history**

In the Elsevier Book DTD 5.2.0 the optional attribute role and optional subelement ce:label were added, and ce:further-reading was made optional/repeatable to allow for Ultra-light delivery of book backfile projects.

In the Elsevier Book DTD 5.3.0 the ce:title was added to allow for proper title and tagging in sync with other DOCTYPES.

The ce:section-title element, child of ce:bibliography should no longer be used for Bibliography item titles.
**body**

**Declaration**

Model (Book DTD 5.1.0–Book DTD 5.2.1)

```xml
<!ELEMENT body ( volume | part | section | ce:include-item )+>
```

Model (Book DTD 5.3.0, Book DTD 5.3.1)

```xml
<!ELEMENT body ( volume | part | section | ce:include-item )+>
<!ATTLIST body
 role CDATA #IMPLIED>
```

**Description**

The element `body` is used to capture all of the material that appears between the front and rear of Elsevier books.

**Usage**

The `body` element is used to delimit and capture the material that appears between the front and rear in Elsevier books. It consists of required and repeatable `volumes` and/or `parts` and/or `sections` and/or `ce:include-item`.

It has an optional `role`.

The element `body`, child of `book`, appears in the hub file for the book. If present, any hierarchy above chapters (e.g. volume, parts, sections) should also be captured using this content model within the hub file.

Lower-level items (doctypes chapter, introduction, examination, and in very rare cases bibliography) within the body get called in to the hub file using `ce:include-item` elements. Other doctypes usually do not get called into `body`.

**XML**

```xml
<body>
  <volume id="vI"><ce:label>Volume I</ce:label>
    <part id="pA"><ce:label>Part A</ce:label>
      <ce:title id="t1">GENERAL ISSUES AND APPROACH TO DISEASE IN PRIMARY CARE MEDICINE</ce:title>
      <ce:include-item>
        <ce:pii>B0-323-01679-0/10027-7</ce:pii>
        <ce:title id="t2">Introduction</ce:title>
        <ce:pages>
          <ce:first-page>1</ce:first-page>
          <ce:last-page>8</ce:last-page>
        </ce:pages>
      </ce:include-item>
      <section id="s1"><ce:label>Section 1</ce:label>
        <ce:title id="t3">Core Issues and Special Groups in Primary Care</ce:title>
        <ce:include-item>
          <ce:pii>B0-323-01679-0/10003-4</ce:pii>
        </ce:include-item>
    </part>
  </volume>
</body>
```
**Version history**

In Elsevier Book DTD 5.3.0 the optional attribute `role` was added.
Chapter 5 – Book DTD

book

 xmlns:xlink CDATA #FIXED %XLINK.xmlns;
 xml:lang %iso639; 'en'
 docsubtype %docsubtype-book; #FIXED "bk">
```

Description

The element `book` is the top-level element for Elsevier books. A majority of books should be able to be captured using the content model from this DTD.

Usage

A Book dataset can be used to capture most Elsevier book publications.

Book content consists of a hub file used to reflect hierarchy in body above chapter, as well as to call all of the lower-level doctypes (e.g. chapter, index) into the book. Contrary to serial publications, where the item and the hub have different DTDs for historical reasons, the hub and items of an Elsevier book are structured with different top-level elements (doctypes) of the same DTD.

The hub’s top-level element is `book`. It consists of required `info` and `top`, optional `ce:floats` and optional `front`, required/repeatable `body`, and optional `rear` elements.

It has several required attributes:
Chapter 5 – Book DTD

2. **version**: 5.3
3. **xmlns:ce**: http://www.elsevier.com/xml/common/dtd
4. **xmlns:xlink**: http://www.w3.org/1999/xlink
5. **xml:lang**: en (default value)
6. **docsubtype-book**: bk (default value)

```xml
<!DOCTYPE book
    PUBLIC "-//ES//DTD book DTD version 5.3.0//EN//XML"
    "book530.dtd" []>
<book>
    <info>
        ...
    </info>
    <top>
        ...
    </top>
    <front>
        ...
    </front>
    <body>
        ...
    </body>
    <rear>
        ...
    </rear>
</book>
```

**Version history**

In the Elsevier Book DTD 5.2.0 the top-level element changed from ehs–book to book. The subelement top was added as was the attribute docsubtype with fixed value bk.

In the Elsevier Book DTD 5.2.1 subelements front and rear were made optional.

In the Elsevier Book DTD 5.3.0, attribute docsubtype, changed from a fixed value of bk, to a default value of bk. Other values are possible (com, dct, or enc), based on the type of book being delivered.

The element body was also made repeatable in v5.3.0 to properly accommodate MRWs into the STAB Book work DTD.

  docsubtype ( chp|ovw ) "chp">
```

Description

The element `chapter` is used to capture book chapters as individual XML files.

Usage

The `chapter` element is used to capture all the material that appears within a book chapter. There is a PUBLIC identifier and a DOCTYPE declaration for chapter, and individual chapter files get called into the book’s hub file using the `ce:include-item` element.

Although the DTD does not restrict where lower-level book doctypes get called into the hub file, the intent is for `chapter` only to be called into `body`, not in `front` or `rear`.

Content for chapter consists of an optional/repeatable `ce:footnote`, a required `info` and the optional `ce:floats` container. The chapter begins with the (optional) `ce:label`, containing the name of the chapter (“Chapter 4”), the chapter title, tagged via the `ce:title` and optional `ce:subtitle` and optional and repeatable `ce:author-group` containing authors and their affiliations. Followed by optional `ce:miscellaneous`, optional/repeatable `ce:abstract`, and optional/repeatable `ce:keywords`. The optional subelements `ce:displayed-quote`, `poem`, optional/repeatable `outline`, optional `objectives`, and optional `ce:nomenclature` also belong to the “head” of the chapter, followed by an optional `ce:acknowledgment`. An introduction or summary is contained in the optional `ce:intro`.

The main body of the chapter consists of a sequence of `ce:sections`, `subchapter` and/or `exam` elements, followed by optional/repeatable `ce:bibliography` and/or `ce:further-reading`, possibly followed by more `ce:sections` and/or `exams` and/or `ce:biographies`.

It has an optional `role`, along with several required attributes:

- `id`
- `version`: 5.3
- `xmlns:ce`: http://www.elsevier.com/xml/common/dtd
Chapter 5 – Book DTD

- `<xml:lang>`: en (default value)
- `<docsubtype>`: chp (default value) or ovw

  </ce:sections>
  <ce:bibliography id="bibl1">...
</ce:bibliography>
</chapter>
```

Version history

In EHS Books DTD 5.1.1 the occurrence indicator for `<ce:author-group>` changed from `?` to `*`. Element `examination` was replaced by `exam` and the `docsubtype` attribute was added. Elements `poem`, `outline` and `objectives` were added. Element `<ce:section>` was changed to `<ce:sections>` to allow chapters to begin with regular paragraphs.

In Elsevier Book DTD 5.2.0, an optional/repeatable `<ce:footnote>` was added to the beginning of the content model for `<chapter>`. The optional attribute `<role>` was also added.
In Elsevier Book DTD 5.2.1 subelement `ce:label` was made optional.

In Elsevier Book DTD 5.3.0 this release of the DTD added optional `ce:miscellaneous`, optional/repeatable `ce:abstract`, and optional/repeatable `ce:keywords`. The element `ce:biography` was also added to the end of the content model for authors of MRW items.

In Elsevier Book DTD 5.3.1 value `ovw` (overview) was added for attribute `docsubtype`.

**Light reading**

Note that PreCAP chapters should be done using the doctype `simple-chapter`. 
cover-image

Declaration

Model (Book DTD 5.2.0–Book DTD 5.3.1)
<!ELEMENT cover-image (ce:figure )>

Description

The element cover-image is used to include cover images for Elsevier books.

Usage

The content for cover-image consists of a single ce:figure.

XML

  <cover-image>
    <ce:figure id="f1">...</ce:figure>
  </cover-image>

Version history

This element first appeared in Elsevier Book DTD 5.2.0. It is optional to be backward compatible with earlier versions of the DTD.
**dedication**

**Declaration**

**Model (Book DTD 5.2.0–Book DTD 5.3.1)**

```xml
<!ELEMENT dedication ( ce:simple-para+ )>
```

**Description**

The element *dedication* is used to tag dedications from book-level authors or editors that often appear in a book’s front matter material.

**Usage**

Content for *dedication* consists of required/repeatable *ce:simple-para*.

```xml
<dedication>
  <ce:simple-para id="sp03">There are so many people I must thank for the help they provided me in the creation of this book...</ce:simple-para>
  <ce:simple-para id="sp04">And what sort of husband and father would I be if I forgot to mention my wonderful wife and children...</ce:simple-para>
</dedication>
```

**Version history**

This element first appeared in Elsevier Book DTD 5.2.0.

This element should no longer be used after DTD 5.2.0 as dedications are now captured as individual items within *front*. See the CAP guide documentation for detailed guidance.
Chapter 5 – Book DTD

ehs-book

Declaration

Model (Book DTD 5.1.0, Book DTD 5.1.1)

<!ELEMENT ehs-book ( info, top, ce:floats?, front, body, rear )>
<!ATTLIST ehs-book

    ...
</ehs-book>
Version history

In Book DTD the new element `top` was added and the attribute `docsubtype`.
This element is superseded by `book` from Book DTD 5.2 onwards.
exam

Declaration

Model (Book DTD 5.1.0–Book DTD 5.2.1)
<!ELEMENT exam ( ce:title?, ce:exam-questions, ce:exam-answers? )>

Model (Book DTD 5.3.0, Book DTD 5.3.1)
<!ELEMENT exam ( ce:title?, ce:exam-questions, ce:exam-answers? )>
<!ATTLIST examid ID #IMPLIED
role CDATA #IMPLIED>

Description

The element exam is used to capture review questions that appear within many different
types of books.

Usage

Content for exam consists of an optional ce:title, required ce:exam-questions and
optional ce:exam-answers.

It has an optional id and optional role.

XML
<exam id="exam1">
    <ce:title id="t1">Quiz from Section 1</ce:title>

Description

The element `examination` is used to capture review questions that appear as their own item within many different types of books.

Usage

The `examination` element is one of the top-level elements (doctypes) of the Books DTD. It is used to capture a series of review questions when they appear as a separate item in their own XML file, using the examination DOCTYPE and PUBLIC identifier, and is called into the central hub file for the book using the `ce:include-item` element.
The content for examination consists of required info, optional ce:floats, optional ce:label, followed by required ce:title, optional/repeatable ce:author-group, optional ce:intro, followed by required/repeatable exam.

It has an optional role, along with several required attributes:

- id
- version: 5.3
- xmlns:ce: http://www.elsevier.com/xml/common/dtd
- xmlns:xlink: http://www.w3.org/1999/xlink
- xml:lang: en (default value)
- docsubtype: exm

XML

```xml
<examination id="exm1" docsubtype="exm">

docsubtype %docsubtype; #REQUIRED>

**Description**

The element **fb-non-chapter** is used to capture special front and back matter non-chapter divisions as individual XML files.

**Usage**

The **fb-non-chapter** top-level element is used to capture material that appears in items that occur within the front (such as foreword, preface, about the author, etc.) and back matter (such as appendices) of books. The element should not be used to capture chapters within the book body.

There is a PUBLIC identifier and DOCTYPE declaration for **fb-non-chapter**, and individual XML files get called into the front and rear of the book’s central hub file using the **ce:include-item** element.

A **docsubtype** attribute is required. The possible values for this attribute include:

- **app**: Appendix
- **bio**: Biography or About the Author
- **for**: Foreword
- **pre**: Preface
- **ack**: Acknowledgments
- **ctr**: Contributors
- **rev**: Reviewers
- **htu**: How to Use this Publication
- **ded**: Dedication
- **cop**: Copyright
- **ret**: Retraction
- **ovw**: Overview

Other values should not be used with **fb-non-chapter**.

The content of **fb-non-chapter** consists of a required **info**, optional **ce:floats**, an optional **ce:label**, an optional **ce:title**, followed by optional and repeatable group of **ce:author-group** **ce:nomenclature** and/or **ce:para** and/or **ce:sections** (the order is the order as these appear in the book) followed by an optional **ce:bibliography**, followed by optional **ce:further-reading**.

It has an optional **role**, along with several required attributes:

- **id**
- **xmlns**: http://www.elsevier.com/xml/book/dtd
- **version**: 5.3
- **xmlns:ce**: http://www.elsevier.com/xml/common/dtd
Version history

Element ce:further-reading was added in EHS Books DTD 5.1.1 to allow for unnumbered references.

In Elsevier Book DTD 5.2.0 the optional attribute role was added.

In a patch to Elsevier Book DTD 5.2.0 the docsubtype ded was added.

In Elsevier Book DTD 5.3.1 the docsubtypes ret and ovw were added.

Light reading

In a PreCAP delivery where the files are structured according to the Elsevier Book DTD 5.2.0, an fb-non-chapter DOCTYPE is delivered with weight UltraLight.
front

Declaration

Model (Book DTD 5.1.0, Book DTD 5.1.1)

```xml
<!ELEMENT front ( ce:include-item )+>
```

Model (Book DTD 5.2.0–Book DTD 5.3.1)

```xml
<!ELEMENT front( ce:include-item+ )>
```

Description

The element `front` is used to capture the front matter of Elsevier books.

Usage

The `front` element is used to delimit and capture the front matter material in Elsevier books. It consists of required and repeatable `ce:include-item` elements. The element `front`, child of `book`, appears in the hub file for the book.

- The table of contents will be only be delivered as part of the “fat” PDF file for printing. An electronic version of the table of contents is replicated by the hub file and could be used by downstream applications for this purpose.
- The list of contributing authors (`docsubtype: ctr`) and/or reviewers (`docsubtype: rev`) should each be converted as a separate `fb-non-chapter` file and called into `front` using `ce:include-item` elements.
- Foreword (`docsubtype: for`), Preface (`docsubtype: pre`), Acknowledgments (`docsubtype: ack`), and Biography (`docsubtype: bio`), should also be converted as separate `fb-non-chapter` files and called into `front` using `ce:include-item` elements.

XML

```xml
<front>
  <ce:include-item>
    <ce:pii>B0-323-01679-0/10027-7</ce:pii>
    <ce:title>Contributors</ce:title>

Description

The element glossary is used to capture glossaries of special terms that can appear in a book’s back matter.

Usage

The glossary element is used to capture a glossary of special terms when they appear in the back matter of a book. When used, glossary will always appear as a top-level element, with its own DOCTYPE declaration and PUBLIC identifier appearing at the top of the XML file. A glossary gets called into the book’s hub file by a ce:include-item element.
The content for glossary consists of required info, followed by optional ce:label, optional ce:title, then optional/repeatable ce:glossary, followed by optional/repeatable ce:bibliography and/or ce:further-reading.

It has an optional role, along with several required attributes:

- id
- version: 5.3
- xmlns:ce: http://www.elsevier.com/xml/common/dtd
- xmlns:xlink: http://www.w3.org/1999/xlink
- xml:lang: en (default value)
- docsubtype: gls

XML

```xml
<!DOCTYPE glossary
PUBLIC "-//ES//DTD book DTD version 5.3.0//EN//XML"
"book530.dtd">
<glossary id="gloss" docsubtype="gls">
  <info>
    <ce:pii>B978-0-323-01679-7.10003-8</ce:pii>
    <ce:isbn>978-0-323-01679-7</ce:isbn>
    <ce:copyright type="full-transfer" year="2003">Mosby, Inc.</ce:copyright>
  </info>
  <ce:title>Glossary</ce:title>
  <ce:glossary>
    <glossary-sec id="gs1">
      <ce:section-title id="st1">A</ce:section-title>
      <ce:glossary-entry id="ge1">
        <ce:glossary-heading>aardvark</ce:glossary-heading>
        <ce:glossary-def>An unusual-looking, long-nosed creature that eats ants.</ce:glossary-def>
      </ce:glossary-entry>
      ...
    </glossary-sec>
  </ce:glossary>
</glossary>
```

Version history

In Elsevier Book DTD 5.2.0 the optional attribute role and optional subelement ce:label were added. Subelement ce:glossary was made optional/repeatable to allow for Ultra-light delivery of book backfile projects.

In the Elsevier Book DTD 5.3.0 the ce:title was added to allow for proper title tagging in synch with other DOCTYPES.

The ce:section-title element, child of ce:glossary should no longer be used for Glossary item titles.
**index**

**Declaration**

    xml:lang %iso639; 'en'
    id ID #REQUIRED
    role CDATA #IMPLIED
    docsubtype %docsubtype; #FIXED "idx">
```

**Description**

The element `index` is used to tag indices of terms which usually appear in a book’s back matter.

**Usage**

The index element will always appear as a top-level element, with its own DOCTYPE declaration and PUBLIC identifier appearing at the top of the XML file. An `index` gets called into the book’s hub file by a `ce:include-item` element.

Content for `index` consists of required `info`, followed by optional `ce:label`, optional `ce:title`, followed by optional/repeatable `ce:index` elements.
Multiple indices (e.g. Subject Index, Author Index, etc.) should be handled as separate index files, called into the book’s hub file with separate ce:include-item elements. Role value subject should be used to differentiate the subject index from any other indices.

Each index should be organized according to the following conventions:

- One ce:index element which encapsulates the complete index.
- Each ce:index element would contain multiple ce:index-sec elements, one for each letter of the alphabet.
- If the terms are separated by alphas that appear in the hardcopy, the ce:section-title, child of ce:index-sec, should contain the letter of the alphabet for each index section.

Due to their large size, it is envisioned that large index files will be developed in smaller pieces at book typesetters, then combined into a single, large file prior to delivery.

It is quite common in hardcopy book indices, in an effort to save space (and paper) that the first second-level index term appears on the same line as its parent primary index term. Therefore, this needs to be tagged as in the following example (where ce:index-heading, etc., have been left out for clarity):

Swallowing, assessment of pediatric variations in

Great care must be taken to ensure that such situations are tagged properly in the following manner:

XML

```xml
<ce:index-entry id="idx824">Swallowing
<ce:index-entry id="idx825a">assessment of</ce:index-entry>
<ce:index-entry id="idx825b">pediatric variations in</ce:index-entry>
</ce:index-entry>
```

It has an optional role, along with several required attributes:

- id
- version: 5.3
- xmlns:ce: http://www.elsevier.com/xml/common/dtd
- xmlns:xlink: http://www.w3.org/1999/xlink
- xml:lang: en (default value)
- docsubtype: idx

XML

```xml
<!DOCTYPE index PUBLIC "-//ES//DTD book DTD version 5.3.0//EN//XML" "book530.dtd" []>
<index docsubtype="idx" id="index">
<info>
<ce:pii>B978-0-7216-9204-3.00001-6</ce:pii>
<ce:isbn>978-0-7216-9204-3</ce:isbn>
<ce:copyright tpe="full-transfer"
year="2003">Mosby, Inc.</ce:copyright>
</info>
<ce:title>Index</ce:title>
<ce:index role="subject">
<ce:index-sec>
<ce:section-title>A</ce:section-title>
<ce:index-entry id="idx001">
```
<index>
  <index-heading>aardvark</index-heading>
  <intra-ref id="iar001" href="...">1</intra-ref>
</index-entry>
</index>

Version history

In Elsevier Book DTD 5.2.0 the optional attribute role and optional subelement ce:label were added. Subelement ce:index was made optional/repeatable to allow for Ultralight delivery of book backfile projects.

In Elsevier Book DTD 5.3.0 the ce:title was also added to allow for proper title and tagging in synch with other DOCTYPES.
info

Declaration

Model (Book DTD 5.1.0–Book DTD 5.3.1)

```xml
```

Description

The element info is a placeholder element for book-level metadata elements.

Usage

The info element contains book-project level metadata for the book item and hub. It duplicates a few items from the metadata transport scheme, but only enough to confirm that the book item and book project match. It contains the metadata of all top-level elements of the Books DTD: book, introduction, chapter, simple-chapter, examination, fb-non-chapter, glossary, bibliography, and index.

XML

```xml

Description

The element `introduction` is used to capture introductory material which often appears at the beginning of parts or sections used to divide/introduce chapters by topic within the body of a book.
Usage

Since parts and/or sections often contain their own introductory material, the top-level introduction element is needed to properly capture this content. It gets called into the book’s hub file using the ce:include-item.

The introduction element consists of optional ce:floats, required ce:title, an optional/repeatable ce:author-group, followed by optional ce:sections, followed by optional/repeatable ce:bibliographys and/or ce:further-readings.

It has an optional role, along with several required attributes:

- id
- version: 5.3
- xmlns:ce: http://www.elsevier.com/xml/common/dtd
- xmlns:xlink: http://www.w3.org/1999/xlink
- xml:lang: en (default value)
- docsubtype: itr

XML

```xml
<!DOCTYPE introduction
PUBLIC "-//ES//DTD book DTD version 5.3.0//EN//XML"
"book530.dtd" []>
<introduction id="part1-intro" docsubtype="itr">

</ce:sections>
</introduction>
```

Version history

For Elsevier Book DTD 5.2.0, the subelement ce:sections was made optional to allow for PreCAP deliveries. The subelement ce:further-reading was also added for items without linked references.
line

Declaration

Model (Book DTD 5.1.1–Book DTD 5.3.1)

```xml
<!ELEMENT line ( %richstring.data; )*>
```

Description

The element **line** is used to capture a line of text from a poem.

Usage

Content for line consists of **line**.

```xml
<line>Roses are red</line>
```

Version history

This element first appeared in EHS Books DTD 5.1.1.

See also

See also elements **poem** and **stanza**.
objectives

Declaration

Model (Book DTD 5.1.1–Book DTD 5.3.1)
<!ELEMENT objectives ( ce:section-title?, ce:para+ )>

Description

The element objectives is used to capture the objectives of a chapter. This information often appears at the beginning of a book chapter.

Usage

Content for objectives consists of an optional ce:section-title, and required/repeatable ce:para.

XML

```xml
<objectives>
  <ce:section-title id="st1">Objectives</ce:section-title>
  <ce:para id="p1">The objectives for this chapter are
    for the student to ....</ce:para>
</objectives>
```

Version history

This element first appeared in EHS Books DTD 5.1.1.
outline

Declaration

Model (Book DTD 5.1.1–Book DTD 5.3.1)

<!ELEMENT outline ( ce:list )>

Description

The element outline is used to capture the outline of a chapter. This material often appears at the beginning of a book chapter.

Usage

Content for outline consists of a required ce:list.

XML

```
<outline>
  <ce:list id="list02">
    <ce:section-title id="st01">Chapter Outline</ce:section-title>
    <ce:list-item id="listi06">
      <ce:para>Introduction</ce:para>
    </ce:list-item>
    <ce:list-item id="listi07">
      <ce:para>Background</ce:para>
    </ce:list-item>
    ...
  </ce:list>
</outline>
```

Version history

This element first appeared in EHS Books DTD 5.1.1.
**part**

**Declaration**

**Model (Book DTD 5.1.0)**

```xml
<!ELEMENT part ( ce:label, ce:title?, ce:author-group*, introduction?, ( section | ce:include-item | ce:bibliography )+ )>
<!ATTLIST part
 id ID #REQUIRED>
```

**Model (Book DTD 5.1.1)**

```xml
<!ELEMENT part ( ce:label, ce:title?, ce:author-group*, ( section | ce:include-item | ce:further-reading )+ )>
<!ATTLIST part
 id ID #REQUIRED>
```

**Model (Book DTD 5.2.0)**

```xml
<!ELEMENT part ( ce:label, ce:title?, ce:author-group*, ( section | ce:include-item | ce:further-reading )+ )>
<!ATTLIST part
 id ID #REQUIRED
 role CDATA #IMPLIED>
```

**Model (Book DTD 5.2.1)**

```xml
<!ELEMENT part ( ce:label?, ce:title?, ce:author-group*, ( section | ce:include-item | ce:further-reading )+ )>
<!ATTLIST part
 id ID #REQUIRED
 role CDATA #IMPLIED>
```

**Model (Book DTD 5.3.0, Book DTD 5.3.1)**

```xml
<!ELEMENT part ( ce:label?, ce:title?, ce:author-group*, ( part | section | ce:include-item | ce:further-reading )+ )>
<!ATTLIST part
 id ID #REQUIRED
 role CDATA #IMPLIED>
```

**Description**

The element **part** is used to capture the hierarchy above chapter and/or section when they occur within an Elsevier book.

**Usage**

The element **part** is a child of **body** and of **volume**. It is used when a large book is divided into parts in order to organize sections and/or chapters into groups. The element **part** appears in the hub file for the book.

The **part** elements can sometimes have their own introductions. These should be tagged as **introduction** and called into the hub file using **ce:include-item**.
In very rare cases, part elements can sometimes have their own bibliography. These should be tagged as bibliography and called into the hub file using ce:include-item.

The part element consists of an optional ce:label, followed by an optional ce:title, an optional/repeatable ce:author-group, then a required and repeatable grouping of parts, sections and/or ce:include-items and/or ce:further-reading.

It has one required attribute, id and one optional attribute, role.

XML

```
<part id="pA"><ce:label>Part A</ce:label>
  <ce:title>GENERAL ISSUES AND APPROACH TO DISEASE IN PRIMARY CARE MEDICINE</ce:title>
  <ce:include-item>
    <ce:pii>B0-323-01679-0/10027-7</ce:pii>
    <ce:title>Introduction</ce:title>
    <ce:pages>
      <ce:first-page>1</ce:first-page>
      <ce:last-page>8</ce:last-page>
    </ce:pages>
  </ce:include-item>
</part>
```

Version history

Element introduction is a top-level element in EHS Books DTD 5.1.0. Since all top-level items are called into the book hub file with ce:include-item, subelement introduction was removed in EHS Books DTD 5.1.1. Subelement ce:bibliography was replaced by ce:further-reading.

In Elsevier Book DTD 5.2.0 the optional attribute role was added.

In Elsevier Book DTD 5.2.1 subelement ce:label was made optional.

In the Elsevier Book DTD 5.3.0 parts were allowed to recurse (part, child of part) to be able to properly handle MRWs.

Known bugs, hacks and problems

The ce:further-reading is deprecated and should no longer be used. It remains to allow for backward compatibility with earlier versions.
poem

Declaration

Model (Book DTD 5.1.1–Book DTD 5.2.1)

```xml
```

Model (Book DTD 5.3.0, Book DTD 5.3.1)

```xml
<!ATTLIST poem id ID #IMPLIED>
```

Description

The element poem is used to capture poetry that sometimes appear at the beginning of some book chapters.

Usage

Content for poem consists of an optional ce:title, optional ce:author, required/repeatable stanza and optional ce:source.

It has an optional id.

```xml
<poem>
  <ce:title>Roses are Red</ce:title>
  <stanza>
    <line>Roses are red</line>
    <line>violets are blue</line>
    ...
  </stanza>
</poem>
```

Version history

This element first appeared in EHS Book DTD 5.1.1.

In the Elsevier Book DTD 5.3.0 the optional id attribute was added.

See also

See also elements stanza and line.
**rear**

**Declaration**

Model (Book DTD 5.1.0–Book DTD 5.3.1)

```xml
<!ELEMENT rear (rearpart+)>
```

**Description**

The element `rear` is used to capture all of the material that appears in the back matter of Elsevier books.

**Usage**

The `rear` element is used to delimit and capture the material that appears in the back matter of Elsevier books. It is used in the book’s hub file and consists of required and repeatable `rearpart`

Lower-level doctypes — `glossary`, `bibliography`, `index`, and `fb-non-chapter` (appendices) — within the rear get called in using `ce:include-item` elements.

Although the DTD does not restrict where lower-level book doctypes get called into the hub file, doctypes other than those listed above should not be called into `rear`.

```xml
<rear>
  <rearpart id="rearpart1">
    <ce:title>Appendices</ce:title>
    <ce:include-item>
      <ce:pii>B0-323-01679-0/10027-7</ce:pii>
      <ce:title>Appendix A</ce:title>
      <ce:pages>
        <ce:first-page>1000</ce:first-page>
        <ce:last-page>1001</ce:last-page>
      </ce:pages>
    </ce:include-item>
    <ce:include-item>
      <ce:pii>B0-323-01679-0/10001-0</ce:pii>
      <ce:title>Appendix B</ce:title>
      <ce:pages>
        <ce:first-page>1002</ce:first-page>
        <ce:last-page>1003</ce:last-page>
      </ce:pages>
    </ce:include-item>
  </rearpart>
  <rearpart id="rearpart2">
    <ce:include-item>
      <ce:pii>B0-323-01679-0/10002-2</ce:pii>
      <ce:title>Glossary</ce:title>
      <ce:pages>
        <ce:first-page>1004</ce:first-page>
        <ce:last-page>1020</ce:last-page>
      </ce:pages>
    </ce:include-item>
  </rearpart>
</rear>
```
rearpart

Declaration

Model (Book DTD 5.1.0, Book DTD 5.1.1)

```
<!ELEMENT rearpart ( ce:label?, ce:title?, ce:include-item+)>
<!ATTLIST rearpart
    id ID #REQUIRED>
```

Model (Book DTD 5.2.0–Book DTD 5.3.1)

```
<!ELEMENT rearpart ( ce:label?, ce:title?, ce:author-group*, ce:include-item+)>
<!ATTLIST rearpart
    id ID #REQUIRED>
<!ATTLIST rearpart
    role CDATA #IMPLIED>
```

Description

The element `rearpart` is used to provide organizational divisions to material (usually appendices) that appears in the back matter of Elsevier books.

Usage

The `rearpart` element is usually used to give named or numbered divisions to material that appears within the back matter of Elsevier Health Science books, usually appendices. If the rear is not divided into parts, then there will only be one `rearpart`. The element appears in the book’s hub file.

It consists of an optional `ce:label`, optional `ce:title`, an optional/repeatable `ce:author-group`, then one or more `ce:include-items`.

It has one required attribute, `id` and one optional attribute, `role`.

XML

```
<rearpart id="rearpart1">
    <ce:label>I</ce:label>
    <ce:title>Graphical Appendices</ce:title>
    <ce:include-item>
        <ce:pii>B0-323-01679-0/10027-7</ce:pii>
        <ce:title>Appendix A</ce:title>
        <ce:pages>
            <ce:first-page>1000</ce:first-page>
            <ce:last-page>1001</ce:last-page>
        </ce:pages>
    </ce:include-item>
    <ce:include-item>
        <ce:pii>B0-323-01679-0/10001-0</ce:pii>
        <ce:title>Appendix B</ce:title>
        <ce:pages>
            <ce:first-page>1002</ce:first-page>
            <ce:last-page>1003</ce:last-page>
        </ce:pages>
    </ce:include-item>
</rearpart>
```
Version history

The optional/repeatable subelement `ce:author-group` and optional attribute `role` were both added in Elsevier Book DTD 5.2.0.
section

Declaration

Model (Book DTD 5.1.0)

```xml
<!ELEMENT section ( ce:label, ce:title?, ce:author-group*, introduction?, ( ce:include-item | ce:bibliography )+ )>
<!ATTLIST section id ID #REQUIRED>
```

Model (Book DTD 5.1.1)

```xml
<!ELEMENT section ( ce:label, ce:title?, ce:author-group*, ( ce:include-item | ce:further-reading )+ )>
<!ATTLIST section id ID #REQUIRED>
```

Model (Book DTD 5.2.0)

```xml
<!ELEMENT section ( ce:label, ce:title?, ce:author-group*, ( ce:include-item | ce:further-reading )+ )>
<!ATTLIST section id ID #REQUIRED role CDATA #IMPLIED>
```

Model (Book DTD 5.2.1–Book DTD 5.3.1)

```xml
<!ELEMENT section ( ce:label?, ce:title?, ce:author-group*, ( ce:include-item | ce:further-reading )+ )>
<!ATTLIST section id ID #REQUIRED role CDATA #IMPLIED>
```

Description

The element `section` is used to capture the hierarchy above chapter if/when they occur within Elsevier books.

Usage

A `section` is used in large books to organize `ce:include-items` (chapters or examinations) into groups. It is a child of `body` and `volume` and/or `part` should not be confused with the common element `ce:section` that is used for subdivisions within items such as chapters.

A `section` can sometimes have its own introduction. These should be tagged as `introduction` and called into the hub file using `ce:include-item`.

In very rare cases, `section` elements can sometimes have their own bibliography. These should be tagged as `bibliography` and called into the hub file using `ce:include-item`.

The `section` element consists of an optional `ce:label`, an optional `ce:title`, an optional/repeatable `ce:author-group`, followed by one or more groupings of `ce:include-items` and/or `ce:sections` and/or `ce:further-reading`.

It has one required attribute, `id` and one optional attribute, `role`. 
Chapter 5 – Book DTD section

XML

```xml
<section id="s1"><ce:label>Section 1</ce:label>
  <ce:title>Core Issues and Special Groups in Primary Care</ce:title>
  <ce:include-item>
    <ce:pii>B0-323-01679-0/10003-4</ce:pii>
    <ce:title>Core Issues in Primary Care</ce:title>
    <ce:pages>
      <ce:first-page>1</ce:first-page>
      <ce:last-page>8</ce:last-page>
    </ce:pages>
  </ce:include-item>
  <ce:include-item>
    <ce:pii>B0-323-01679-0/10027-7</ce:pii>
    <ce:title>Special Groups in Primary Care</ce:title>
    <ce:pages>
      <ce:first-page>9</ce:first-page>
      <ce:last-page>18</ce:last-page>
    </ce:pages>
  </ce:include-item>
</section>
```

Version history

Element `introduction` is a top-level element in EHS Books DTD 5.1.0. Since all top-level items are called into the book hub file with `ce:include-item`, subelement `introduction` was removed. Subelement `ce:bibliography` was replaced by `ce:further-reading`.

In Elsevier Book DTD 5.2.0 the optional attribute `role` was added.

In Elsevier Book DTD 5.2.1 subelement `ce:label` was made optional.

Known bugs, hacks and problems

The `ce:further-reading` is deprecated and should no longer be used. It remains to allow for backward compatibility with earlier versions.
simple-chapter

Declaration

Model (Book DTD 5.2.0)

```xml

<!ATTLIST simple-chapter
  id ID #REQUIRED
  xmlns CDATA #FIXED %ESBK.xmlns;
  version CDATA #FIXED '5.2'
  xmlns:ce CDATA #FIXED %ESCE.xmlns;
  xmlns:xlink CDATA #FIXED %XLINK.xmlns;
  xml:lang %language; 'en'
  role CDATA #IMPLIED
  docsubtype %docsubtype; #FIXED "scp">
```

Model (Book DTD 5.2.1)

```xml

<!ATTLIST simple-chapter

  role CDATA #IMPLIED
  docsubtype %docsubtype; #FIXED "scp">
```

Model (Book DTD 5.3.0, Book DTD 5.3.1)

```xml
```
Description

The element simple-chapter is used to capture book chapters as individual XML files, but only in a PreCAP backfile conversion project.

Usage

The simple-chapter element is used to capture all the material that appears within a book chapter. There is a PUBLIC identifier and a DOCTYPE declaration for simple-chapter, and individual chapter files get called into the book’s hub file using the ce:include-item element.

Although the DTD does not restrict where lower-level book doctypes get called into the hub file, the intent is for simple-chapter only to be called into body, not in front or rear.

The content for simple-chapter consists of an optional/repeatable ce:footnote, a required info and the optional ce:floats container. The chapter begins with the (optional) ce:label, containing the name of the chapter (“Chapter 4”), the chapter title, captured by use of the ce:title, and optional and repeatable ce:author-group containing authors and their affiliations. Followed by optional ce:miscellaneous, optional/repeatable ce:abstract. The optional subelements ce:displayed-quote, poem, outline, objectives, and ce:nomenclature also belong to the “head” of the chapter, followed by an optional ce:acknowledgment. An introduction or summary is contained in the optional ce:intro.

The main body of the chapter consists of a optional/repeatable sequence of ce:sections, subchapter and/or exam elements, followed by optional/repeatable ce:bibliography and/or ce:further-reading, possibly followed by more ce:sections and/or exams and/or ce:biographies.

It has an optional role, along with several required attributes:

- id
- version: 5.3
- xmlns:ce: http://www.elsevier.com/xml/common/dtd
- xmlns:xlink: http://www.w3.org/1999/xlink
- xml:lang: en (default value)
- docsubtype: scp

  </ce:bibliography>
</simple-chapter>

Version history

This top element was added in Elsevier Book DTD 5.2.0 to allow for deliveries of book backfile projects.

In Elsevier Book DTD 5.2.1 subelement ce:label was made optional.

In Elsevier Book DTD 5.3.0 added optional ce:miscellaneous, and optional/repeatable ce:abstract and optional/repeatable ce:biographies.
stanza

Declaration

Model (Book DTD 5.1.1–Book DTD 5.3.1)
<!ELEMENT stanza ( line+ )>

Description

The element stanza is used to capture a block of lines from a poem.

Usage

Content for stanza consists of required/repeatable line.

XML
<stanza>
  <line>Roses are red</line>
  <line>violets are blue</line>
  ...
</stanza>

Version history

This element first appeared in EHS Books DTD 5.1.1.

```

Model (Book DTD 5.2.0, Book DTD 5.2.1)

```xml
<!ELEMENT subchapter ( ce:footnote*, ce:label?, ce:title,
  ce:author-group*, ce:displayed-quote?,
  ce:nomenclature?, ce:acknowledgment?,
  ce:intro?, ( ce:sections | subchapter
  | exam )*, ( ce:bibliography |
  ce:进一步-reading )+, ( ce:section | exam )*)>
```

```xml
<!ATTLIST subchapter
  id ID #REQUIRED
  role CDATA #IMPLIED>
```

Model (Book DTD 5.3.0, Book DTD 5.3.1)

```xml
<!ELEMENT subchapter ( ce:footnote*, ce:label?, ce:title,
  ce:author-group*, ce:displayed-quote?,
  ce:nomenclature?, ce:acknowledgment?,
  ce:intro?, ( ce:sections | subchapter
  | exam )*, ( ( ce:bibliography |
  ce:进一步-reading )+ | ce:section ),
  ( ce:section | exam )* )? )>
```

```xml
<!ATTLIST subchapter
  id ID #REQUIRED
  role CDATA #IMPLIED>
```

Description

The element subchapter is used to capture large portions of hierarchy that occur within book chapters.
Usage

Quite frequently, book chapters are so large, that the subchapter element is needed to capture the complex hierarchy that occurs within them. Such divisions of chapters are often written by separate authors and will often contain their own references. For this DTD, the hierarchy below chapter that has its own author(s) and/or references should be tagged as a subchapter. Hierarchy below chapter which does not have its own author(s) or references should be done as ce:sections.

Content for the subchapter element is similar to the structure of its parent, chapter, and consists of an optional/repeatable ce:footnote, an optional ce:label, a required ce:title, optional and repeatable ce:author-group. Followed by optional ce:date-received, optional/repeatable ce:date-revised, optional ce:date-accepted, and optional/repeatable ce:keywords, optional ce:displayed-quote and ce:nomenclature, followed by an optional ce:acknowledgment, optional introductory text in ce:intro, followed by required/repeatable ce:sections and/or nested subchapters and/or exams, followed by optional/repeatable ce:bibliography and/or ce:further-reading, followed by optional/repeatable ce:sections and/or exams.

It has one required attribute, id and one optional role.

XML

```xml
<subchapter id="sc11">
  <ce:label>1.1</ce:label>
  <ce:title>Summary of Primary Care Today</ce:title>
  <ce:author-group>
    ...
  </ce:author-group>
  <ce:intro>
    <ce:para>Text of introductory paragraph...</ce:para>
  </ce:intro>
  <ce:section>
    <ce:title>Opening section title</ce:title>
    <ce:para>Text of first paragraph...</ce:para>
    <ce:para>Text of second paragraph...</ce:para>
  </ce:section>
  <ce:bibliography>
    ...
  </ce:bibliography>
</subchapter>
```

Version history

In EHS Books DTD 5.1.1 the occurrence indicator for ce:author-group changed from ? to * . Element examination was replaced by exam and the docsubtype attribute was added. Element ce:section was changed to ce:sections to allow subchapters to begin with regular paragraphs.

In Elsevier Book DTD 5.2.0, an optional/repeatable ce:footnote was added to the beginning of the content model for subchapter. The optional attribute role was also added.

In Elsevier Book DTD 5.3.0 reference end-notes were made optional.
**top**

**Declaration**

**Model (Book DTD 5.1.0)**

```xml
<!ELEMENT top (%titles; , ce:edition , ce:copyright-line , ce:editors?, ce:author-group* , ce:dedication? , ce:sections )>
```

**Model (Book DTD 5.1.1)**

```xml
<!ELEMENT top (%titles; , ce:edition , ce:copyright-line , ce:editors? , ce:author-group* , ce:dedication* , ce:sections )>
```

**Model (Book DTD 5.2.0)**

```xml
<!ELEMENT top (%titles; , ce:edition , ce:copyright-line , cover-image? , ce:editors* , ce:author-group* , ce:dedication* , ce:sections )>
```

**Model (Book DTD 5.2.1–Book DTD 5.3.1)**

```xml
<!ELEMENT top (%titles; , ce:edition? , ce:copyright-line , cover-image? , ce:editors* , ce:author-group* , ce:dedication* , ce:sections )>
```

**Description**

The element `top` is another placeholder element for book-level metadata elements.

**Usage**

The info element contains book-project level metadata for the book item. It also contains material intended to render the following non-item material: title page, copyright page, and dedication (if present).

```xml
<top>
  <ce:title>Mosby's Clinical Nursing</ce:title>
  <ce:editors>
    <ce:author-group>...</ce:author-group>
    <ce:author-group>...</ce:author-group>
  </ce:editors>
  <ce:copyright-line>Copyright &copy; 2002 Mosby, Inc.</ce:copyright-line>
  <cover-image>...</cover-image>
</top>
```

148 Elsevier Documentation for the XML DTD 5 Family
Version history

In EHS Books DTD 5.1.1 the occurrence indicator for `ce:dedication` changed from `?` to `*`.

In the Elsevier Book DTD 5.2.0 the optional `cover-image` was added while `ce:dedication` was replaced by `dedication` to properly allow for book dedications that tend to be more elaborate than articles.

In the Elsevier Book DTD 5.2.1 the element `ce:edition` was made optional.

Due to changes over time, the `top` has become largely empty. Author dedications and the copyright page are now both now delivered as items within `front`. Refer to the CAP guides for specific detailed guidance.
volume

Declaration

Model (Book DTD 5.1.0, Book DTD 5.1.1)

```xml
<!ELEMENT volume ( ce:label, ( part | section | ce:include-item )+ )>
<!ATTLIST volume
  id ID #REQUIRED>
```

Model (Book DTD 5.2.0)

```

Model (Book DTD 5.2.1–Book DTD 5.3.1)

```xml
<!ELEMENT volume ( ce:label?, ce:title?, ce:author-group*,
  ( part | section | ce:include-item )+ )>
<!ATTLIST volume
  id ID #REQUIRED
  role CDATA #IMPLIED>
```

Description

Unlike journals, where a volume is a collection of journal issues, volumes in Elsevier books are usually only due to limitations of binding. In rare cases, they can also be used to delimit topical hierarchy as well. The element `volume` is used to capture material that appears between separately bound volumes of a multi-volume book if they occur within Elsevier books.

Usage

The `volume` element, a child of `body`, is used to delimit and capture the material that appears between each separately bound volume if/when they occur. It should be noted that only the `ce:include-items` and hierarchy above them (material within `body`) appears within volume. This differs from many hardcopy multi-volume books where front and back matter gets repeated in each separately bound volume.

The `volume` element consists of an optional `ce:label` (often a Roman numeral), an optional `ce:title`, an optional/repeatable `ce:author-group`, followed by required/repeatable `parts` and/or `sections` and/or `ce:include-items`.

It has one required attribute, `id` and one optional attribute, `role`.

Version history

In Elsevier Book DTD 5.2.0 optional ce:title, optional/repeatable ce:author-group, and optional attribute role were added.

In Elsevier Book DTD 5.2.1 subelement ce:label was made optional.

In the Elsevier Book DTD 5.3.0 part was allowed to recurse (part, child of part) to be able to properly handle MRWs.
# PITs: Book publication item types

The attribute `docsubtype` of the top-level elements of the book DTD contains the publication item type of the book chapter or book hub. Its possible values are contained in `%docsubtype;` and `%docsubtype-book;` and are described here.

<table>

This chapter contains an alphabetic listing of the elements in the enhancement fragment DTD, the EF DTD. This DTD is used to structure the content of material that is added to the online versions of journal items or book chapters after they have been published.

The EF DTD will be used to add “book updates” to online book chapters. These were formerly known as “darts”. So-called eAbstracts will also be captured by this DTD. eAbstracts are complete articles that are derived from articles in Clinics journals. Many more uses are foreseen.

The EF DTD defines one top-level element: enhancement-fragment.

**CEP version used in this DTD**

The enhancement fragment DTD 5.0.0 described in this documentation uses the common element pool version 1.1.6.
**enhancement-fragment**

**Declaration**

**Model (EF DTD 5.0)**

```xml
<!ELEMENT enhancement-fragment ( info, target, ce:floats?, fragment-text )>
<!ATTLIST enhancement-fragment
    xmlns CDATA #FIXED %ESEF.xmlns;
    version CDATA #FIXED '5.0'
    xmlns:ce CDATA #FIXED %ESCE.xmlns;
    xmlns:sb CDATA #FIXED %ESSB.xmlns;
    xmlns:xlink CDATA #FIXED %XLINK.xmlns;
    xml:lang %iso639; 'en'
    docsubtype CDATA #REQUIRED>
```

**Description**

The element `enhancement-fragment` contains the complete enhancement fragment.

**Usage**

The element `enhancement-fragment` is the only top-element in the EF DTD. It is used to structure enhancement fragments.

There are several attributes of the element, as follows.

- The attribute `docsubtype` contains the type of the fragment. Unlike other DTDs, the EF DTD does not contain the list of possible values. For every type of enhancement fragment different values are defined. For book updates the following values are allowed:
  - `abs`: abstract
  - `com`: commentary
  - `crct`: corrections made by the enhancement fragment (not errata)
  - `fcr`: focused review
  - `hop`: hot off the press
  - `lbct`: late breaking clinical trial
  - `note`: notification of corrections
  - `ref`: additional references
  - `upd`: update

  For eAbstracts only one value is allowed:
  - `eabs`: eAbstract

- The attribute `xml:lang` specifies the language in which the enhancement fragment is written (default English, en). See ISO 639 set of entities (p. 178) for an overview of the allowed language codes.

- The fixed attribute `xmlns` sets the default namespace for EF elements, and the other fixed attributes beginning with `xmlns`: set the prefix and the namespace of elements used in the DTD, e.g. those of the common element pool (`xmlns:ce` and `xmlns:sb`) and of the XLink standard (`xmlns:xlink`). Since these attributes are fixed, they need not be specified as they are inferred by the parser.

- `version` is fixed to the first two digits of the version of the DTD.
Information on the enhancement fragment is stored in element `info`. The target is identified in element `target`. Element `fragment-text` contains the content of the enhancement fragment. The optional `ce:floats` contains the necessary floats, similar to the JA DTD.
Chapter 6 – Enhancement Fragment DTD

exam

Declaration

Model (EF DTD 5.0)

<!ELEMENT exam (ce:title?, ce:exam-questions, ce:exam-answers?)>
<!ATTLIST exam
  id ID #REQUIRED
  role CDATA #IMPLIED>

Description

The element exam is used to capture review questions that appear within many different types of books.

Usage

This element is structured identical to the exam element in the Book DTD. It is used in the same way.
**fragment-text**

**Declaration**

**Model (EF DTD 5.0)**

```xml
<!ELEMENT fragment-text ( ce:footnote*, ce:label?, %titles;,
    ce:author-group*, ce:displayed-quote?,
    ce:date-received?, ce:date-revised*,
    ce:date-accepted?, ce:miscellaneous?,
    ce:abstract*, ce:keywords*,
    ce:nomenclature?, ce:acknowledgment?,
    ce:sections, ( ce:bibliography |
    ce:further-reading )*, ( ce:section |
    exam )*)>
```

```xml
<!ATTLIST fragment-text
    id ID #REQUIRED
    role CDATA #IMPLIED>
```

**Description**

The element `fragment-text` contains the content of the enhancement fragment.

**Usage**

The model of this element is based on the models of element `head` of the JA DTD and element `subchapter` of the Book DTD.

`fragment-text` has a mandatory `id` and an optional `role`. 
info

Declaration

Model (EF DTD 5.0)

```xml
<!ELEMENT info ( ce:pii, ce:copyright, ce:imprint?, ce:doctopics? )>
```

Description

The element **info** contains information about the enhancement fragment.

Usage

The enhancement fragment is identified by a PII, **ce:pii**. The PII of an enhancement fragment is based on the PII of the target but the format depends on the type of enhancement fragment.

The PII of a book update enhancement fragment is made up of the PII of the target, a type identifier (**bu**), the ID of an XML fragment in the target, and a sequence number. It does not have a check digit. The parts are separated by a period, except for the last two which are separated by a “u”. This is done to ensure uniqueness of unformatted PII.

The PII of an eAbstract enhancement fragment is made up of the PII of the target and the type identifier (**ea**). The parts are joined by a hyphen. It does not have a check digit.

The mandatory **ce:copyright** contains the copyright owner and status of the item.

The imprint under which a book project is published can be stored in the optional element **ce:imprint** while the optional element **ce:doctopics** can be used to associate the enhancement fragment with one or more topic hierarchies.

```xml
<info>
    <ce:pii>B978-1-4160-3675-3.50009-5.bu.cesec37u1</ce:pii>
    <ce:copyright type="full-transfer" year="2011">Elsevier, Inc.</ce:copyright>
</info>
```
location

Declaration

Model (EF DTD 5.0)

```xml
<!ELEMENT location EMPTY>
<!ATTLIST location
    id ID #IMPLIED
    refid CDATA #IMPLIED
    placement CDATA #IMPLIED
    sequence NMTOKEN #IMPLIED>
```

Description

The element `location` contains the exact location for an enhancement fragment in a journal article or book chapter.

Usage

`location` has four optional attributes. It can be identified by the attribute `id`.

An enhancement fragment can be “attached” to a specific place in a journal article or book chapter. The exact place is in fact an XML fragment (element) and its ID is stored in attribute `refid`. Attribute `placement` indicates where the enhancement fragment is to be placed. The values used so far are `before` and `after`.

Attribute `sequence` contains a sequence number, in case there are more than one enhancement fragment for that specific place and position. The number must be unique amongst all `sequence` numbers of enhancement fragments for a specific place and position.

See `target` for an example location.
target

**Declaration**

**Model (EF DTD 5.0)**

```xml
<!ELEMENT target ( ce:pii, location? )>
<!ATTLIST target
  id ID #REQUIRED
  role CDATA #IMPLIED>
```

**Description**

The element `target` contains information about the target of the enhancement fragment.

**Usage**

The `target` element is identified by the mandatory attribute `id`.

An enhancement fragment is “attached” to a journal article or a book chapter which is identified by its PII in `ce:pii`. The element `location` can be used to attach the enhancement fragment to a specific place in the article or chapter.

An enhancement fragment is considered to be attached to the whole article or chapter if the `location` is not present or if it is present without its `refid` and `placement` attributes.

```xml
<target id="target.0050">
  <ce:pii>B978-1-4160-3675-3.50009-5</ce:pii>
  <location id="loc1" refid="cesec83" placement="after" sequence="1"/>
</target>
```
Chapter 7

The Common Element Pool

The common element pool (CEP), a phrase coined by Jabin White, contains elements that are common to all or some of the Elsevier DTDs. The common elements are subdivided in six namespaces:

- the “core” common element pool, whose elements are described in Chapter 8,
- the elements for structured affiliations, described in Chapter 9,
- the elements for structured bibliographic references, described in Chapter 10,
- the MathML elements, with Elsevier modifications, described in Chapter 11,
- the CALS table elements and the Extended CALS table elements, both described in Chapter 12.

This chapter (Chapter 7) contains general notions regarding the common element pool and the XML files that are structured according to the DTDs that use it. When individual elements are mentioned, their details can be found in the above-mentioned chapters.

Observe that the common element pool is used by several DTDs and contains elements shared by several of these DTDs, but not necessarily all. For instance, the JA DTD does not contain elements such as `ce:isbn`, `ce:index`, `ce:index-flag` or `ce:intra-ref`. In some cases this is accomplished by parametrization using parameter entities.
Versions of the common element pool

This section describes the changes in the common element pool (CEP) since its first release as version 1.0.0. It also lists which DTDs make use of that particular version of the common element pool.

CEP 1.1.0

- The following elements were added: `ce:isbn`, `ce:issn`, `ce:include-item`, `ce:pages`, `ce:first-page`, `ce:last-page`, `ce:copyright-line`, `ce:index-flag`, `ce:index-flag-term`, `ce:index-flag-see`, `ce:index-flag-see-also`.
- The following parameter entities were added: `%common-altimg.att;`, `%common-view.att;`, `%tbl.tgroup.att;`.
- Parameter entity `%titles;` was renamed to `%sb.titles;` and a new parameter entity `%titles;` was introduced.
- Element `ce:article-thread` was replaced by `ce:document-thread` and element `ce:refers-to-article` was replaced by `ce:refers-to-document`.
- Element `sb:comment`’s model was changed to allow for more content.
- Elements `ce:glossary` and `ce:index` now contain `ce:intro` in their models.
- Element `ce:textbox-tail` now contains `ce:glossary` and `ce:biography` in its model.
- Element `ce:author` now has an attribute `author-id`.
- Attribute `xml:lang` of `ce:abstract` now takes its values in `%iso639;`.
- The following elements now have an attribute `view`: `ce:appendices`, `ce:bibliography`, `ce:lecture`, `ce:lecture-notes`, `ce:lecture-reference`, `ce:lecture-questions`, `ce:lecture-answers`.
- The following elements now use `%sb.titles;` instead of `%titles;`: `sb:contribution`, `sb:series`, `sb:book`, `sb:edited-book`.

CEP 1.1.0 patch level 1

The journal article (JA) DTD 5.0.1 makes use of this version of the CEP.

- The model of element `ce:e-component` was repaired to allow for multiple nested `ce:link` and `ce:e-component` subelements instead of just one.

CEP 1.1.0.1

The journal article (JA) DTD 5.0.2 makes use of this version of the CEP.

- New parameter entity `%common-reqaltimg.att;` was added.
- New elements `ce:markers` and `ce:marker` were added.

CEP 1.1.1

- Element `ce:imprint` was added.
- The notation declarations were extended with system identifiers.
- Value it was added to parameter entity `%language;`.
- The titles in element `ce:include-item` were made optional.
Chapter 7 – The Common Element Pool

CEP 1.1.2

The EHS Books DTD 5.1.0 makes use of this version of the CEP.

- The following elements were added: ce:edition, ce:editors, ce:br.
- The following parameter entities were added: %copyright;, %external-file.att;, %tbl.colspec.att;, %tbl.row.att;.
- Parameter entity %size-info.att; was removed.
- Element ce:br was added to parameter entity %cell.data;.
- The following elements now have parameter entity %cross-ref; instead of element ce:cross-ref in their model: ce:collaboration, ce:author.
- The attribute list of ce:link was changed; it now consists of attributes id and locator.
- Element ce:caption now has an attribute list with attributes role and xml:lang.
- The models of elements ce:e-component, ce:alt-e-component, ce:figure and ce:textbox were changed to allow for more than one ce:caption.
- The model of parameter entity %tbl.titles; was changed to allow for more than one ce:caption; it now also contains parameter entity %copyright;.

CEP 1.1.3

The serial issue DTD 5.1.0, the EHS Books DTD 5.1.1 and the Elsevier Book DTDs 5.2.0 and 5.2.1 make use of this version of the CEP.

- The following elements were added: ce:source, ce:reader-see.
- Parameter entity %see; was introduced.
- Element ce:index-entry now uses element ce:reader-see, and parameter entity %see; instead of element ce:see.
- Element ce:source was added to the models of elements ce:figure, ce:textbox, ce:e-component, and to the model of parameter entity %tbl.titles;.

CEP 1.1.4

This CEP was intended to be used by the major reference works (MRW) DTD 5.0.0.

- New parameter entities %glossary-entry-refs; and %index-entry-refs; were added.
- Element ce:indexed-name was added to the models of elements ce:glossary-entry and ce:index-entry.
- Element ce:reader-see was added to the model of element ce:glossary-entry.
- New parameter entity %common-regaliting.att; was added.
- New elements ce:markers and ce:marker were added.

CEP 1.1.5

The journal article (JA) DTD 5.1.0 makes use of this version of the CEP.

- New parameter entity %text-objects; was added to the model of parameter entity %note.data;.
- Parameter entity %language; was removed and replaced by parameter entity %iso639; in the models of elements ce:ce:alt-title, ce:alt-subtitle and ce:keyword.
- Attribute role was added to the model of element ce:e-component.
- New elements ce:grant-sponsor and ce:grant-number were added.
Versions of the common element pool

Chapter 7 – The Common Element Pool

CEP 1.1.6

The Elsevier Book DTDs 5.3.0 and 5.3.1 make use of this version of the CEP.

- Attributes id, role and view were added to the model of numerous elements.
- Element ce:section-title was made optional in the models of elements ce:further-reading, ce:glossary and ce:index.
- Element ce:text was added to the model of element ce:author-group.

CEP 1.2.0

The journal article (JA) DTD 5.2.0 and the serial issue (SI) DTD 5.2.0 make use of this version of the CEP.

- Element ce:copyright-line was added to parameter entity %copyright;.
- New element ce:alt-name was added to parameter entity %name;.
- Values sda, author-highlights and editor-highlights were added to parameter entity %abstract-class;.
- Value free-of-copyright was added to parameter entity %copyright-type;.
- Attribute id was added to the model of numerous elements.
- Attribute role was added to the model of ce:author-group and ce:abstract-sec.
- Attribute orcid was added to the model of elements ce:author, sb:author and sb:editor.
- A new namespace for structured affiliation elements was added. Element sa:affiliation was added to the model of ce:affiliation.
- Elements ce:e-address and ce:author-group were added to the model of element ce:collaboration.
- Element ce:source was added to the model of element ce:displayed-quote.
- Element ce:keywords was added to the model of elements ce:figure, ce:table, ce:Textbox and ce:e-component.
- The model of sb:host was changed to allow sb:book to be followed by sb:pages.
- The model of sb:series was changed to allow series without titles.
- Attribute class was added to the model of element sb:book.
Cross-references and the ce:label element

Cross-referencing with the one-to-many ce:cross-refs is complicated. The content of that element is popularly thought of as the text to click on — but there is only one text to click on while there are multiple destinations. An online rendering of the document will want to present the user with a list of possible destinations. In this section, we assume that that list is in the form of a drop-down menu with destinations; in practice applications have often chosen to present the destinations inline. (For more details about that, see ce:cross-refs.)

The element ce:cross-refs must have more than one destination. The element ce:cross-ref is used for a simple link. Each destination is a valid id in the document. Elements may have ids whether or not they are being referred to.

The structure of the document must guarantee that such a drop-down list of destinations can be created. A crucial role is played by the ce:label elements of the destinations, because their content is used to fabricate the drop-down list. (In fact, this is a simplification, because not all elements possess a ce:label, but it is a concept worth remembering; more precise details are found below.)

The elements ce:intra-refs and ce:inter-refs are different. These elements conform to the XLink standard, and contain the names of the destinations in their subelements ce:intra-ref-title and ce:inter-ref-title. In the Output DTD each ce:cross-ref can be converted to ce:intra-ref.

In order to make one-to-many links work it is wrong, and even impossible, to analyze the content of the ce:cross-refs. The application should rely on the XML structure. To this end, there is a collection of rules which are described in this section. Roughly, the rules subscribe to the “drop-down menu principle”, which states that the destinations of the one-to-many link are the ce:label elements of the destination objects.

As an example, consider a document containing displayed equations Eqs. (2)–(14). The equations (4)–(13) are supplied on a graphic and they are shown in Scheme 6 (i.e., not captured in XML); the other equations are captured in XML. The following figure illustrates what happens if reference is made in the text to “Eqs. (2)–(14)”.

```
see <ce:cross-refs refid="fd2 fd3 sch6 fd14">Eqs. (2)&ndash;(14)</ce:cross-refs>
```

```
see Eqs. (2)–(14)
(2) → <ce:formula id="fd2"><ce:label>(2)</ce:label>
(3) → <ce:formula id="fd3"><ce:label>(3)</ce:label>
Scheme 6 → <ce:figure id="sch6"><ce:label>Scheme 6</ce:label>
(14) → <ce:formula id="fd14"><ce:label>(14)</ce:label>
```

The “drop-down” menu, indicated above by the box underneath the “Eqs. (2)–(14)” (the text to click on), contains the ce:label elements of the four destinations, not all of which are displayed equations.

The rules for cross-referencing depend on the element. For each situation, a suggested “drop-down menu item” text is given below. In some cases, it is not even allowed to use ce:cross-refs to certain destinations.
Even though the XML validation checks the validity of the rules, rendering applications should be able to deal with exceptions and error situations. The id itself, for instance, could be used as a last resort.

**No ce:cross-refs allowed**

It is not allowed to use the one-to-many `ce:cross-refs` to the following destinations:

It is, of course, allowed to use `ce:cross-ref`.

**Mandatory ce:label**

If the following elements are the target of a `ce:cross-refs`, they must have a `ce:label` element:

(*) Ensured by the DTD. The suggested “drop-down” text is the content of `ce:label`.

**Mandatory ce:section-title**

If the following elements are the target of a `ce:cross-refs` they must have a `ce:section-title` element:

(*) Ensured by the DTD. The suggested “drop-down” text is the content of the `ce:section-title`.

**Mandatory ce:label or ce:section-title**

If the following elements are the target of a `ce:cross-refs` (plural), they must have a `ce:label` and/or a `ce:section-title` element:

- `ce:definition`, `ce:list`, `ce:section`.

The suggested “drop-down” text is the concatenation of the `ce:label` and the `ce:section-title`.

**Element ce:formula**

If the `ce:formula` does not contain nested `ce:formulae`, then it must have a `ce:label` subelement if it is the target of `ce:cross-ref` or `ce:cross-refs`.

If the `ce:formula` has nested `ce:formula` subequations, then the following rules apply.

1. If the top `ce:formula` is the target of a cross-reference (`ce:cross-ref` or `ce:cross-refs`), either it must possess a `ce:label` element itself or all nested `ce:formulae` must possess one.
2. If a nested \texttt{ce:formula} is the target of a cross-reference, it must have a \texttt{ce:label} element.

3. A \texttt{ce:label} may not occur on both the top and the nested level.

The suggested “drop-down menu” item text belonging to an \texttt{id} contains the content of the \texttt{ce:label} or the \texttt{ce:labels} of the sublevel.

\textbf{Elements} \texttt{sb:reference, ce:other-ref}

If beside an \texttt{sb:reference} the parent \texttt{ce:bib-reference} does not contain any other \texttt{sb:reference} nor any \texttt{ce:other-ref}s, then the \texttt{sb:reference} may not be the target of a cross-reference. (The reference must be made to the \texttt{ce:bib-reference}.)

If beside a \texttt{ce:other-ref} the parent \texttt{ce:bib-reference} does not contain any other \texttt{ce:other-ref} nor any \texttt{sb:reference}s, then the \texttt{ce:other-ref} may not be the target of a cross-reference. (The reference must be made to the \texttt{ce:bib-reference}.)

Any elements \texttt{sb:reference} and \texttt{ce:other-ref} that are the target of a cross-reference, must have a \texttt{ce:label} subelement.

All bibliographic references within \texttt{ce:bibliography} must be referred to from within the document (unless the XML file is of the HEAD-AND-TAIL variety). This means that for each \texttt{ce:bib-reference} at least one reference is made to either the \texttt{id} of the \texttt{ce:bib-reference} (and to zero or more child-\texttt{sb:reference}s and child-\texttt{ce:other-ref}s) or to the \texttt{ids} of all child-\texttt{sb:reference}s and all child-\texttt{ce:other-ref}s.

The elements \texttt{sb:reference} and \texttt{ce:other-ref} are “incomplete” cross-reference targets: their \texttt{ce:label} element is not meaningful for cross-referencing purposes without the \texttt{ce:label} element of their parent. This means that, in a one-to-many link with \texttt{sb:reference} and/or \texttt{ce:other-ref} elements, the “drop-down menu” (see earlier in this section) should show a combination of the \texttt{ce:label} elements of the cross-referenced \texttt{sb:reference} or \texttt{ce:other-ref} and that of the parent \texttt{ce:bib-reference} element.

\texttt{XML}

\begin{verbatim}
<ce:para>...
  Refs. <ce:cross-refs refid="bb2a or3b bib4">[2a,3b,4]</ce:cross-refs>
...</ce:para>
<ce:bibliography>...
    <sb:reference id="bb2a"><ce:label>(a)</ce:label>...</sb:reference>
    <sb:reference id="bb2b"><ce:label>(b)</ce:label>...</sb:reference>
  </ce:bib-reference>
    <sb:reference id="bb3a"><ce:label>(a)</ce:label>...</sb:reference>
    <other-ref id="or3b"><ce:label>(b)</ce:label>...</other-ref>
  </ce:bib-reference>
</ce:bibliography>
\end{verbatim}
Cross-references and the ce:label element

\]
Text effects

The text effect elements are listed in the parameter entity \%text-effect; and include the elements \texttt{ce:sup, ce:inf, ce:hsp, ce:vsp}, the font-decoration elements \texttt{ce:underline, ce:cross-out}, as well as the five font-changing elements. The element \texttt{ce:br} is also considered to be a text effect element.

The content of the font-changing and font-decoration elements and the text effects \texttt{ce:sup} and \texttt{ce:inf} is described by the parameter entity \%richstring.data;: They may contain text, but no footnotes, anchors, cross-references and MathML formulae.

Font-changing and font-decoration elements

The opening tag of a font-changing or font-decoration element changes the properties of the font. The font-decoration elements and most font-changing elements, the font-style changing elements, change only one aspect of the current font, but other font-changing elements, the font-family changing elements, replace the current font. The closing tag undoes the changes and restores the font properties to the values that were in effect at the opening tag.

The font-changing elements are listed in the parameter entity \%font-change;: Their meaning is listed in Table 4.

</tr>
<tr>
<td>\texttt{ce:sans-serif}</td>
<td>\texttt{<a href="">ce:sans-serif</a>A&lt;/ce:sans-serif&gt;         }</td>
<td>\texttt{A}</td>
</tr>
</tbody>
</table>

The default font, i.e. the font that is used when no font-changing element is open, is defined by the journal style. In print that is the journal’s typesetting instructions. There are no font-changing elements to set the font to the default font. One can only revert to the default font by closing all font-changing elements.

Combinations of font-changing and font-decoration elements

For all types of font-changing and font-decoration elements that can be combined with each other, the order in which they are opened is irrelevant.

Font-family changing elements \texttt{ce:sans-serif, ce:monospace}. The font-family changing elements \texttt{ce:sans-serif} and \texttt{ce:monospace} are mutually exclusive. If these elements
are nested, the outer font-family changing element loses its effect until the inner font-family changing element is closed.

**Font-style changing elements** `ce:italic`, `ce:bold` and `ce:small-caps` and **font-decoration elements** `ce:cross-out`, `ce:underline`. The font-style changing elements `ce:italic`, `ce:bold` and `ce:small-caps` and the font-decoration elements `ce:cross-out` and `ce:underline` can be combined with each other and with each of the font-family changing elements. The font-style changing elements have the effect of changing the style of the current font. The font-decoration elements have the effect of adding underlining or cross-out to the current font.

**Text effect element** `ce:br`. Text element `ce:br` can only be used in cells.

**Copy edit considerations**

Care must be taken that font-changing elements are switched off to avoid unwanted effects. For instance, compare the following two examples where a formula is structured outside MathML (which is to be avoided):

**XML**

```
<ce:italic>f(x<ce:sup>2</ce:sup>)</ce:italic>
```

**Presentation**

\[ f(x^2) \]

**Explanation**

Observe that the parentheses and the superior 2 are italicized.

**XML**

```
<ce:italic>f</ce:italic>(<ce:italic>x</ce:italic><ce:sup>2</ce:sup>)
```

**Presentation**

\[ f(x^2) \]

Font-changing and font-decoration elements cannot contain anchors and cross-references. When such an element occurs in a text with a font change or decoration, the font-changing or font-decoration elements must be closed before the element, opened at the start of the element’s content and closed again at its end, and opened again after the element.

**XML**

```
```

**Presentation**

See Ref. [2] for an important restriction.

Font-changing elements should not be used to introduce a style. For instance, if titles are to be displayed in caps and small caps, this should be handled by the document style and not by the use of the element `ce:small-caps`.

**Rendering notes**

Rendering applications should be aware that certain glyphs may change appearance when a font-changing element is applied (e.g. a sans-serif “jnodot”).
Version history

Prior to DTD 5.0, elements `ce:italic`, `ce:bold`, `ce:small-caps`, `ce:monospace` and `ce:sans-serif` were called `it`, `b`, `scp`, `ty` and `ssf`, respectively.

As open-face, German (fraktur) and script characters should only appear in math mode, the elements `ge` and `sc` have no counterparts in DTD 5.0. See the chapter on MathML (Chapter 11, p. 479) for more information.

The elements `ce:cross-out` and `ce:underline` were introduced in DTD 5.0 by popular demand.
Parameter entities

Here we list the parameter entities that are used in the DTDs. Parameter entities are used to define common parts of a DTD, i.e., parts that are (or could be) used several times. We distinguish three groups of parameter entities, according to their role in the DTDs.

Data entities

Data entities contain elements that appear within the text; each data entity contains a group of elements that play a similar role in the structuring of an article, and that therefore appear as alternatives of each other.

```xml
<!ENTITY % font-change "ce: bold|ce: italic|ce: monospace|ce: sans-serif| ce: small-caps">
<!ENTITY % text-effect "%font-change;|ce: sup|ce: inf|ce: underline| ce: cross-out|ce: hsp|ce: vsp">
<!ENTITY % text-objects "ce: anchor|ce: grant-sponsor|ce: grant-number">
<!ENTITY % lists "ce: def-list|ce: list">
<!ENTITY % display "ce: display|ce: displayed-quote|ce: enunciation">
<!ENTITY % string.data "#PCDATA %local.string.data;">
<!ENTITY % richstring.data "#PCDATA|ce: glyph|%text-effect;| ce: inline-figure %local.richstring.data;">
<!ENTITY % text.data "%richstring.data;|mml: math %local.text.data;">
<!ENTITY % textfn.data "%text.data;|ce: footnote| %cross-ref-s; %local.textfn.data;">
<!ENTITY % textref.data "%text.data;|%cross-ref-s;| %inter-ref-s; %local.textref.data;">
<!ENTITY % nondisplay.data "%textref.data;|ce: footnote| ce: anchor %local.nondisplay.data;">
<!ENTITY % note.data "%textref.data;|%display;|%lists;| %text-objects; %local.note.data;">
<!ENTITY % cell.data "%textref.data;|%display;|%lists;|%cell-borders; | tb: alignmark|ce: br %local.cell.data;">
<!ENTITY % spar.data "%textref.data;|%display;|%lists;|ce: footnote| %text-objects; %local.spar.data;">
<!ENTITY % par.data "%textref.data;|ce: float-anchor|%display;| %lists;|ce: footnote| %text-objects; %local.par.data;">
```

The “local” entities, e.g. %local.par.data; or %local.spar.data;, are all declared to be empty in the common element pool. However, they can be used by DTDs to add elements to the content of the data entities. For example, in books it is useful to add information to the text that can later be used to generate an index. This can be done with `ce:index-flag`. The Elsevier Book DTD therefore declares the following two “local” entities:

```xml
<!ENTITY % local.par.data "| ce:index-flag">
<!ENTITY % local.spar.data "| ce:index-flag">
```
The effect is that `ce:index-flag` can appear in any element that has `%par.data;` or `%spar.data;` in its content model.

The above `.data` entities were introduced to make the DTD more restrictive. Table 5 shows which elements in the common element pool have which parameter entity as content model.

<table>
<thead>
<tr>
<th>Parameter entity</th>
<th>Elements with that data model</th>
</tr>
</thead>
<tbody>
<tr>
<td>%string.data;</td>
<td><code>ce:copyright</code>, <code>ce:doi</code>, <code>ce:edition</code>, <code>ce:indexed-name</code>, <code>ce:initials</code>, <code>ce:isbn</code>, <code>ce:issn</code>, <code>ce:pii</code>, <code>sb:isbn</code>, <code>sb:issn</code></td>
</tr>
<tr>
<td>%textfn.data;</td>
<td><code>ce:alt-title</code>, <code>ce:alt-subtitle</code>, <code>ce:chem</code>, <code>ce:dedication</code>, <code>ce:presented</code>, <code>ce:subtitle</code>, <code>ce:textfn</code>, <code>ce:title</code></td>
</tr>
<tr>
<td>%textref.data;</td>
<td><code>ce:grammar-heading</code>, <code>ce:index-heading</code>, <code>ce:textref</code></td>
</tr>
<tr>
<td>%nondisplay.data;</td>
<td><code>ce:section-title</code>, <code>sb:comment</code>, <code>mml:mtext</code></td>
</tr>
<tr>
<td>%note.data;</td>
<td><code>ce:note-para</code>, <code>ce:source</code></td>
</tr>
<tr>
<td>%cell.data;</td>
<td><code>entry</code></td>
</tr>
<tr>
<td>%spar.data;</td>
<td><code>ce:simple-para</code></td>
</tr>
<tr>
<td>%par.data;</td>
<td><code>ce:para</code></td>
</tr>
<tr>
<td>%parsec;</td>
<td><code>ce:sections</code></td>
</tr>
<tr>
<td>%name;</td>
<td><code>sb:author</code>, <code>sb:editor</code></td>
</tr>
</tbody>
</table>

The general-purpose elements `ce:text`, `ce:textfn` and `ce:textref` use these data entities also and are used as containers in order to avoid mixed content.

To find out which elements can be used in e.g. `%textfn.data;` the parameter entities in its model need to be expanded. Parameter entities in an expanded model also need to be expanded, etc. If we take the “local” entities to be empty, then it becomes clear that `%textfn.data;` can contain everything `%text.data;` can contain as well as the elements `ce:footnote`, `ce:cross-ref`, `ce:cross-refs`, `ce:inter-ref` and `ce:inter-refs`. Entity `%textref.data;` can contain the same elements as `%textfn.data;` except for `ce:footnote`; additionally elements `ce:inter-ref` and `ce:inter-refs` are allowed.

The elements `ce:note-para` and `ce:simple-para` are variants of the paragraph element in which fewer structures are allowed. The following elements consist of simple paragraphs: `ce:abstract-sec`, `ce:biography`, `ce:caption`, `ce:legend`, `ce:note` (in the

**Content model entities**

Content model entities contain pieces of content model that are shared by several elements.

```xml
<!ENTITY % copyright "ce:copyright, ce:copyright-line?">
<!ENTITY % name "(( ( ce:given-name, ce:surname ) | ( ce:surname, ce:given-name? ) ), ce:suffix?, ce:alt-name* )">
<!ENTITY % parsec "( ce:para | ce:section )*">
<!ENTITY % titles "( ce:title, ce:subtitle?, ( ce:alt-title, ce:alt-subtitle? )* )">
<!ENTITY % sb.titles "(( sb:title, sb:translated-title? ) | sb:translated-title )">
<!ENTITY % cross-ref-s "%cross-ref;|%cross-refs;">
<!ENTITY % inter-ref-s "ce:inter-ref|ce:inter-refs">
```

The following parameter entities are overruled by other DTDs. The local declarations are described in the documentation of the other DTDs. Below are the default values.

```xml
<!ENTITY % see "ce:see">
<!ENTITY % glossary-entry-refs"( ce:see+ | ( ce:cross-ref | ce:intra-ref | ce:inter-ref )* )">
<!ENTITY % index-entry-refs"( ce:see+ | ( ce:cross-ref | ce:intra-ref )+ )">
<!ENTITY % cross-ref "ce:cross-ref|ce:intra-ref">
<!ENTITY % cross-refs "ce:cross.refs|ce:intra-refs">
```

**Attribute type entities**

Attribute type entities contain sets of possible values for attributes.

```xml
<!ENTITY % abstract-class "(author|editor|graphical|teaser|author-highlights|editor-highlights|sda)">
<!ENTITY % copyright-type "(full-transfer|limited-transfer|no-transfer|unknown|us-gov|crown|society|other|joint|free-of-copyright)">
<!ENTITY % e-address-type "(email|url)">
<!ENTITY % hline "(bar|tcub|bcub|tsqb|bsqb|circ|tilde|larr|rarr|harr|haru|hbaru|tpar|bpar)">
<!ENTITY % language "(de|en|es|fr|it|pt|ru)">
<!ENTITY % language-type "(en|non-en|iso|unknown)">
<!ENTITY % loc "(pre|post)">
<!ENTITY % style "(s|d|t|da|dot|b|bl|n)">
<!ENTITY % view "(compact|standard|extended|compact-standard|standard-extended|all)">
```

"176 Elsevier Documentation for the XML DTD 5 Family"
In addition there are the attribute type entities `%iso639`; and `%glyph-names;`. Entity `%iso639;` contains the ISO 639 list of language codes. These codes are described in a separate section (p. 178).

Entity `%glyph-names;` contains the names of additional allowed glyphs (not present as Unicode characters). They are described in the section Elsevier's additional glyphs (p. 27). See also the description of `ce:glyph`.

**Version history**

In CEP 1.1.1 value `it` was added to `%language;`.

In CEP 1.1.2 `ce:br` was added to `%cell.data;`. Entities `%copyright;` and `%external-file.att;` were introduced while `%size-info.att;` was removed.

In CEP 1.1.3 `%see;` was introduced.

In CEP 1.1.4 `%see;` was removed while `%glossary-entry-refs;` and `%index-entry-refs;` were added. Entity `%common-regalting.att;` was added to CEPs 1.1.4 and 1.1.0.1.

In CEP 1.1.5 `%text-objects;` was added. It replaced element `ce:anchor` in `%note.data;`, `%spar.data;` and `%par.data;`. Entity `%language;` was removed.

In CEP 1.1.6 elements `ce:see` and `ce:inter-ref` were added to entity `%glossary-entry-refs;`, while multiple `ce:see` elements were made possible in entity `%index-entry-refs;`.

In CEP 1.2.0 `ce:alt-name` was added to `%name;` and `ce:copyright-line` was added to `%copyright;`. Additionally values author-highlights, editor-highlights and sda were added to `%abstract-class;`, while value free-of-copyright was added to `%copyright-type;`.

Elsevier Documentation for the XML DTD 5 Family
ISO 639 list of language codes

This section gives a description of the two-letter languages codes from International Standard ISO 639. These codes are used by all elements whose xml:lang attributes take their values in %iso639;.

</table>
Views

The need to distinguish several product types and to support these from a single source XML file, has led to the introduction of the view attribute. The following common elements possess a view attribute: ce:appendices, ce:bibliography, ce:biography, ce:exam-answers, ce:exam-questions, ce:exam-reference, ce:进一步-reading, ce:glossary, ce:include-item, ce:index, ce:para, ce:section and ce:简单-para. Some elements in the DTDs also possess this attribute, e.g. body in the JA DTD.

The values that this attribute can take are listed in %view;, they are: compact, standard, extended, compact-standard, standard-extended and all (default, meaning all three views). If no view attribute is specified, this is the same as all.

In this model, an application decides it is either “compact”, “standard” or “extended”. An application that has, say, extended views displays all elements whose view attribute has values all, standard-extended and extended and ignores all elements with other values.

<table>
<thead>
<tr>
<th>Application</th>
<th>Render only elements with views</th>
</tr>
</thead>
<tbody>
<tr>
<td>compact</td>
<td>all, compact, compact-standard</td>
</tr>
<tr>
<td>standard</td>
<td>all, standard, compact-standard, standard-extended</td>
</tr>
<tr>
<td>extended</td>
<td>all, extended, standard-extended</td>
</tr>
</tbody>
</table>

Online applications such as ScienceDirect® are typically “extended” applications, while the printed version typically is “standard”. Palmtop devices and such could be “compact”.

Online versus extended

While it is useful to visualize “extended” as the online product and standard as the print product, this is not necessarily the case. It should be perfectly possible to print an extended product — or, create a web PDF file for it. There are numerous cases of products where a PDF file appears online of a full journal article, while the printed issue only contains the abstract.

Views should not be confused with electronic components. Electronic components are captured with ce:e-component. These are external files that in principle could contain anything. It is mistake to think that these can only appear in “extended” views; indeed, they can appear in compact, standard and extended views. On paper, this means showing the ce:alt-e-component subelement, only in electronic products one can, of course, benefit from the real electronic component. Note that a web PDF file, although an “electronic file”, is not suitable for e-components, yet, as explained above, it may well contain the extended view.

Floats (figures, tables, textboxes, electronic components) that only appear within some views, say only in extended views, are contained within ce:floats along with the other floats. Their ce:float-anchor can be found within an extended section or paragraph.

Hence, e-component vs. conventional and standard view vs. extended view are two independent things, indeed all four combinations make sense, including:

- A figure within an extended view. This is a figure that satisfies all the CAP specifications for artwork regarding file types and resolution.
• An e-component within any view. This can, in principle, be any external component varying: audio, video, spreadsheets, source documents. Still images can also be e-components: this signals that the artwork has not undergone the stringent CAP validation. In media that cannot handle the e-component, `ce:alt-e-component` is used.

**Views within views**

Applications choose to be exactly one of “compact”, “standard”, or “extended”. If an application encounters an element with a view that is not meant for it, it should skip the element completely, irrespective of what it contains.

For instance, if an “extended” application encounters a section with a `compact-standard` view, it ignores that whole section completely. If, within that section there happen to be paragraphs or sections with views `extended`, then these will not display in the extended application at all, and also the paragraphs with the default view `all` will not be picked up by the extended application. Consequently, views within views only make sense if they narrow down the view.

**Example 1.**

The first example deals with a collection of electronic components that are added to the online version. The printed version only contains a link to the online version.

```xml
<ce:appendices>
  <ce:section view="compact-standard">
    <ce:label>Appendix A</ce:label>
    <ce:section-title>Background data</ce:section-title>
    <ce:para>The online version of this article contains additional background data in the form of Microsoft Excel spreadsheets and in additional maps. Please visit http://dx.doi.org/10.1016/j.cagd.2004.01.003.</ce:para>
  </ce:section>
  <ce:section view="extended">
    <ce:label>Appendix A</ce:label>
    <ce:section-title>Background data</ce:section-title>
    <ce:para>The results of the experiments of the previous sections are included as Microsoft Excel spreadsheets. The first spreadsheet, `<ce:cross-ref refid="ec1">Spreadsheet 1</ce:cross-ref>` is ordered by country, while `<ce:cross-refs refid="ec2 ec3">Spreadsheets 2 and 3</ce:cross-refs>` are ordered by population.</ce:para>
    <ce:para>Furthermore, the data is displayed in thirty-seven maps of the largest world cities, `<ce:cross-ref refid="map1 map2 ... map37">Maps I&ndash;XXXVII</ce:cross-ref>`.</ce:para>
  </ce:section>
</ce:appendices>
```

**Explanation**

The printed product would display the first `ce:section`, explaining that the online version contains additional background data. The second `ce:section` would be displayed by
The float anchors refer to electronic components within `ce:floats`.

**Example 2**

In some publications, it is common to publish the appendices only online. The printed product only contains the main body of the text. This is achieved using `ce:appendices` with an extended view.

Similarly, there are journals for which some less important articles only appear full text online; the printed product merely contains the head of the article. This is achieved by furnishing `body` and `tail` with an extended view only.

**Cross-referencing to the right view**

It is only allowed to cross-reference to a destination that is contained within equal or wider view than where the cross-reference appears, so as to avoid linking to a destination that does not exist in a certain rendering.

Suppose that there are two sections, one compact-standard and one extended, created in order to obtain two parallel views of the section. Suppose both sections contain a version of the same enunciation Theorem 1. Then the only way to cross-reference to Theorem 1 from within a portion of the text is to also create two parallel paragraphs with different views, each containing a `ce:cross-ref` to the appropriate version of the enunciation.
Chapter 8

The Elements of the CEP

This chapter contains an alphabetic listing of the elements in the “core” common element pool; i.e., it excludes the elements for structuring bibliographic references, MathML and Extended CALS tables.
ce:abstract

Declaration

Model (CEPs 1.1.0–1.1.5)

```xml
<!ELEMENT ce:abstract ( ce:section-title?, ce:abstract-sec+, ce:figure? )>
<!ATTLIST ce:abstract
  id ID #IMPLIED
  class %abstract-class; "author"
  xml:lang %iso639; #IMPLIED>
```

Model (CEPs 1.1.6, 1.2.0)

```xml
<!ELEMENT ce:abstract ( ce:section-title?, ce:abstract-sec+, ce:figure? )>
<!ATTLIST ce:abstract
  id ID #IMPLIED
  view %view; 'all'
  class %abstract-class; "author"
  xml:lang %iso639; #IMPLIED>
```

Description

The element `ce:abstract` is used to capture abstracts in a variety of forms.

Usage

The word “abstract” has various different meanings in publishing. For instance, a very short article, often in conference proceedings, is called an abstract, and so are short summaries of articles or chapters appearing in the frontmatter. The element `ce:abstract` is used to capture abstracts in the latter sense. It consists of an optional title, one or more abstract-sections, and an optional figure. It has three attributes, `id`, `class` and `xml:lang`. For each combination of `class` and `xml:lang`, only one abstract may exist in the document.

The language of the abstract, when different from the language of the article, should be specified in the `xml:lang` attribute. It takes its values in the ISO 639 set of entities (p. 178).

The type of abstract is specified by the `class` attribute, which takes its values in `%abstract-class`; containing the following values.

- `author` (default) is used for abstracts supplied by the author.
- `author-highlights` is a short list of article highlights supplied by the author.
- `editor` is used for abstracts supplied by the editor.
- `editor-highlights` is a short list of article highlights supplied by the editor.
- `graphical` is used for graphical abstracts. Only these abstracts may contain the optional `ce:figure`.
- `sda` is used for structural digital abstracts. An SDA is a structured summary of protein interactions mentioned in the article.
- `teaser` is used for short “teaser” abstracts that attract the attention of the reader. Usually, the teaser abstracts are not found in the rendering of the item itself; instead, they are commonly used to create an extended table of contents of an issue (i.e., a table of contents interspersed with teaser abstracts). 

184 Elsevier Documentation for the XML DTD 5 Family
Abstract sections may have a section title, and each `ce:abstract-sec` except the first must have a section title.

Graphical abstracts have a `ce:figure`. If they contain text, this text comes in the usual place, in `ce:abstract-sec` elements before the figure.

**Presentation**

Copper chloride-catalyzed S-arylation of arenethiols is effected with activated aryl chlorides in water by using ethylenediamine as the pair ligand/base.

![Copper chloride-catalyzed S-arylation](image)

**XML**

```xml
<ce:abstract class="graphical" id="abs002">
  <ce:section-title id="secti003">Graphical abstract</ce:section-title>
  <ce:abstract-sec id="abss003">
    <ce:simple-para id="sp003">Copper chloride-catalyzed S-arylation of arenethiols is effected with activated aryl chlorides in water by using ethylenediamine as the pair ligand/base.</ce:simple-para>
  </ce:abstract-sec>
  <ce:figure id="f001">
    <ce:link locator="fx1"/>
  </ce:figure>
</ce:abstract>
```

**XML**

```xml
<ce:abstract class="author-highlights" id="abs003">
  <ce:section-title id="secti004">Highlights</ce:section-title>
  <ce:abstract-sec id="abss004">
    <ce:list id="list001">
      <ce:list-item id="listi001">
        <ce:label>&#x02022;</ce:label>
        <ce:para id="p001">We solve an open problem left by Clifford and Popa.</ce:para>
      </ce:list-item>
    </ce:list>
  </ce:abstract-sec>
</ce:abstract>
```
We show that finding $k$ subsets of maximum intersection is NP-hard.

We also show that the problem is hard to approximate.

Presentation

Highlights

- We solve an open problem left by Clifford and Popa.
- We show that finding $k$ subsets of maximum intersection is NP-hard.
- We also show that the problem is hard to approximate.

Rendering notes

Abstracts, especially of the non-author classes, are not necessarily presented in the article. It is not uncommon for abstracts to be presented in an extended table of contents.

Copyright lines appended to the abstract are implied by the ce:copyright element.

Version history

Prior to DTD 5.0, this element was called abs. Then the heading was generated automatically, it did not contain an id attribute, and the class attribute had no default value. As from CEP 1.1.0 the xml:lang attribute takes its values in %iso639; The view attribute was added in CEP 1.1.6. The class values author-highlights, editor-highlights and ada were added in CEP 1.2.0.
ce:abstract-sec

Declaration

Model (CEPs 1.1.0–1.1.5)

```xml
<!ELEMENT ce:abstract-sec ( ce:section-title?, ce:simple-para+ )>
```

Model (CEP 1.1.6)

```xml
<!ELEMENT ce:abstract-sec ( ce:section-title?, ce:simple-para+ )>
<!ATTLIST ce:abstract-sec
  id ID #IMPLIED
  view %view; 'all'>
```

Model (CEP 1.2.0)

```xml
<!ELEMENT ce:abstract-sec ( ce:section-title?, ce:simple-para+ )>
<!ATTLIST ce:abstract-sec
  id ID #IMPLIED
  role CDATA #IMPLIED
  view %view; 'all'>
```

Description

The element `ce:abstract-sec` contains a section within the abstract.

Usage

See `ce:abstract`.

Version history

The `id` and `view` attributes were added in CEP 1.1.6, while the `role` attribute was added in CEP 1.2.0.
ce:acknowledgment

Declaration

Model (CEPs 1.1.0–1.1.5)
<!ELEMENT ce:acknowledgment ( ce:section-title?, ce:para+ )>
<!ATTLIST ce:acknowledgment
  id ID #IMPLIED>

Model (CEPs 1.1.6, 1.2.0)
<!ELEMENT ce:acknowledgment ( ce:section-title?, ce:para+ )>
<!ATTLIST ce:acknowledgment
  id ID #IMPLIED
  role CDATA #IMPLIED
  view %view; 'all'>

Description

The element ce:acknowledgment is used to capture the acknowledgment section within the body.

Usage

The acknowledgment section has an optional section title and consists of one or more paragraphs.

XML
<ce:acknowledgment>
  <ce:section-title>Acknowledgment</ce:section-title>
  <ce:para id="cepara0045">The editors thank Bill Bernickus, Jeroen Hogendorp, Simon Pepping, Chris Sturhann and Michael Ward for their contributions.</ce:para>
</ce:acknowledgment>

Version history

Prior to DTD 5.0, this element was called ack. Then it did not have a ce:section-title. The role and view attributes were added in CEP 1.1.6.

ce:affiliation

Declaration

Model (CEPs 1.1.0–1.1.6)

<!ELEMENT ce:affiliation ( ce:label?, ce:textfn )>
<!ATTLIST ce:affiliation
id ID #IMPLIED
role CDATA #IMPLIED>

Model (CEP 1.2.0)

<!ELEMENT ce:affiliation ( ce:label?, ce:textfn, sa:affiliation? )>
<!ATTLIST ce:affiliation
id ID #IMPLIED
role CDATA #IMPLIED>

Description

Affiliations are captured using the element ce:affiliation.

Usage

An author group (ce:author-group) may contain any number of affiliations.

It is allowed to have affiliations with no associated authors or collaborations. Such affiliations cannot have an id, because each affiliation with an id must be referred to. An affiliation with an id must have a ce:label element.

The ce:label element does not contain presentational elements, only the label of the affiliation. Linking of affiliations to authors is described under the ce:author-group element.

The actual content of the affiliation is found within the ce:textfn container subelement.

It is followed by sa:affiliation that contains the affiliation again, in a structured way. The element is optional for backward compatibility reasons, but it is required to be present.

XML

<ce:affiliation id="aff1">
  <ce:label>a</ce:label>

Chapter 8 – The Elements of the CEP

**ce:alt-e-component**

**Declaration**

**Model (CEPs 1.1.0–1.1.1)**

```
<!ELEMENT ce:alt-e-component ( ce:link | ( ce:caption, ce:link? ) )>
```

**Model (CEPs 1.1.2–1.1.6)**

```
<!ELEMENT ce:alt-e-component ( ce:link | ( ce:caption+, ce:link? ) )>
```

**Model (CEP 1.2.0)**

```
<!ELEMENT ce:alt-e-component ( ce:link | ( ce:caption+, ce:link? ) )>
<!ATTLIST ce:alt-e-component id ID #IMPLIED>
```

**Description**

The element `ce:alt-e-component` contains an alternative to an electronic component, e.g. a frame of a movie.

**Usage**

See `ce:e-component`.

**Version history**

As from CEP 1.1.2 the caption is repeatable. The `id` attribute was added in CEP 1.2.0.
ce:alt-name

Declaration

Model (CEP 1.2.0)
<!ELEMENT ce:alt-name ( %richstring.data; )*>

Description

An alternate name for the author or editor is tagged using ce:alt-name. The attribute xml:lang indicates the language of the alternate name.

Usage

The ce:alt-name element is primarily used to capture the author's name in a language different from the language of the item. This is common in articles written by Asian authors. It is not meant to capture a nickname, a maiden name or a different spelling of a name.

XML
<ce:author-group>
  <ce:author>
    <ce:surname>Jin</ce:surname>
    <ce:given-name>Chao</ce:given-name>
    <ce:alt-name>&#x9773; &#x8D85;</ce:alt-name>
  </ce:author>
</ce:author-group>

Presentation
Jin Chao (靳 超)

Version history

ce:alt-name was added in CEP 1.2.0.

ce:alt-subtitle

Declaration

Model (CEPs 1.1.0–1.1.4)
<!ELEMENT ce:alt-subtitle ( %textfn.data; )*>
<!ATTLIST ce:alt-subtitle xml:lang %language; #REQUIRED>

Model (CEPs 1.1.5, 1.1.6)
<!ELEMENT ce:alt-subtitle ( %textfn.data; )*>
<!ATTLIST ce:alt-subtitle xml:lang %iso639; #REQUIRED>

Model (CEP 1.2.0)
<!ELEMENT ce:alt-subtitle ( %textfn.data; )*>
<!ATTLIST ce:alt-subtitle id ID #IMPLIED xml:lang %iso639; #REQUIRED>

Description

The element ce:alt-subtitle contains the subtitle of an article, chapter, or other item.

Usage

The element ce:alt-subtitle is used to capture the subtitle of an item, e.g. a journal article or book chapter, in an alternative language. It has one mandatory attribute xml:lang, which specifies the language of the alternative title. See ISO 639 set of entities (p. 178) for an overview of the allowed language codes.

For more information about subtitles, see ce:subtitle.

XML

<ce:title>The Common Element Pool</ce:title>
<ce:subtitle>A modular approach to DTD design</ce:subtitle>
<ce:alt-title xml:lang="de">Der Pool der gemeinsamen Elemente</ce:alt-title>
<ce:alt-subtitle xml:lang="de">Eine modulare Weise des DTD Entwurfs</ce:alt-subtitle>

Version history

In DTDs prior to DTD 5.0, the element abt fulfilled the function of both ce:subtitle and ce:alt-subtitle; the language was specified in the parent atl element. In CEP 1.1.1 the value it was added to parameter entity %language;. As of CEP 1.1.5, all languages contained in %iso639; are allowed. Attribute id was added in CEP 1.2.0.

See also

ce:alt-title, ce:subtitle, ce:title
The element `ce:alt-title` contains a title of an article, chapter, or other item, in an alternative language.

Usage

The element `ce:alt-title` is used to capture a title in a language different from the language of the item; it occurs one or more times within its parent element. It has one mandatory attribute `xml:lang`, which specifies the language of the alternative title. See ISO 639 set of entities (p. 178) for an overview of the allowed language codes.

Version history

In DTDs prior to DTD 5.0, the element `atl` fulfilled the function of both `ce:title` and `ce:alt-title`; moreover, it contained the subtitle within it. In CEP 1.1.1 the value it was added to parameter entity `%language;`. As of CEP 1.1.5 the complete list of languages contained in `%iso639;` can be used. Attribute `id` was added in CEP 1.2.0.

`ce:alt-subtitle, ce:subtitle, ce:title`
ce:anchor

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:anchor ( %richstring.data; )*>
<!ATTLIST ce:anchor
  id ID #REQUIRED
  role CDATA #IMPLIED>
```

Description

The element `ce:anchor` is a piece of text that can be the target of a cross-reference.

Usage

An anchor is a (possibly empty) piece of text that can be the target of a cross-reference. It is similar to `<A NAME="..."/>` in HTML.

Anchor is special because it may have empty content, and it is an element referred without possessing a `ce:label` element.

```xml
<ce:anchor id="anc1">CH<ce:inf>3</ce:inf>C<ce:glyph name="tbnd6"/>N (<ce:bold>23</ce:bold>)</ce:anchor>
```

A solution containing 20mmol of `<ce:cross-ref refid="anc1"><ce:bold>23</ce:bold></ce:cross-ref>`

The attribute `role` can be used to attach a certain meaning to the anchor. Currently no roles have been defined.

Light reading

`ce:anchor` may not be used in CONTENTS-ENTRY-ONLY, HEAD-ONLY or HEAD-AND-TAIL files.
ce:appendices

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:appendices ( ce:section+ )>
<!ATTLIST ce:appendices
    view %view; 'all'>

Description

The element ce:appendices contains the appendix matter (consisting of one or more appendices, each a ce:section) of a document.

XML

<ce:appendices>
    <ce:section id="app1">

ce:section
ce:article-footnote

Declaration

Model (CEPs 1.1.0–1.1.5)

<!ELEMENT ce:article-footnote ( ce:label?, ce:note-para+ )>

Model (CEPs 1.1.6, 1.2.0)

<!ELEMENT ce:article-footnote ( ce:label?, ce:note-para+ )>
<!ATTLIST ce:article-footnote role CDATA #IMPLIED>

Description

The element ce:article-footnote is used to capture “article footnotes”. These are footnotes that are commonly displayed at the title, and that contain information relevant to the whole article. Important information that must be presented with any rendering of the article, such as acknowledgment of grants, is usually the content of the ce:article-footnote.

Usage

Each article footnote is a separate ce:article-footnote which consists of the footnote symbol in ce:label and a sequence of note paragraphs, ce:note-para.

XML

```
<ce:article-footnote>
  <ce:label>&z.star;</ce:label>
  <ce:note-para>An earlier version of this article appeared in ...</ce:note-para>
</ce:article-footnote>
<ce:article-footnote>
  <ce:label>&z.star;&z.star;</ce:label>
  <ce:note-para>This work was supported by NSF NYI grant CCR-9457806.</ce:note-para>
</ce:article-footnote>
```

Version history

Prior to DTD 5.0, the element was called atlfn. Then it did not contain a separate element for the footnote label. The role attribute was added in CEP 1.1.6.
ce:author

**Declaration**

**Model (CEPs 1.1.0–1.1.1)**

```xml
<!ATTLIST ce:author
  id ID #IMPLIED
  role CDATA #IMPLIED
  author-id CDATA #IMPLIED
  biographyid IDREF #IMPLIED>
```

**Model (CEPs 1.1.2–1.1.6)**

```xml
<!ATTLIST ce:author
  id ID #IMPLIED
  role CDATA #IMPLIED
  author-id CDATA #IMPLIED
  biographyid IDREF #IMPLIED>
```

**Model (CEP 1.2.0)**

```xml
<!ATTLIST ce:author
  id ID #IMPLIED
  role CDATA #IMPLIED
  orcid CDATA #IMPLIED
  author-id CDATA #IMPLIED
  biographyid IDREF #IMPLIED>
```

**Description**

Each author of the item is captured using ce:author.

**Usage**

The element ce:author consists of optional initials, if these cannot be inferred from the first name (ce:initials), an optional name under which the author should appear in an index (ce:indexed-name), optional degrees (ce:degrees), a possible first (given) name (ce:given-name) followed or preceded by a surname (family name, ce:surname), an optional alternate name (ce:alt-name), an optional generation indication (ce:suffix), more optional degrees (ce:degrees), an optional indication of the importance of the author (ce:ranking), optionally the roles the author has (ce:roles), cross-references to the author’s affiliation(s) and to author footnotes (ce:cross-ref), a number of electronic addresses of the author (ce:e-address), and a link to a picture of the author (ce:link).
For more details, see these subelements. A `<ce:cross-ref>` should refer to a `<ce:footnote>` in a `<ce:author-group>` (possibly different from the current one). The surname may precede the first name; the order of these elements within `<ce:author>` determines the order in which they must be rendered.

The `<ce:author>` element has an attribute `biographyid` which is used to refer to a biography (`<ce:biography>`) of the author.

The attribute `id` can be used to link to the author. The attribute `author-id` is meant to contain a unique identification of the author, coming from a central Elsevier author database. Attribute `orcid` on the other hand contains a unique identification of the author coming from a global author database: the ORCID (Open Research & Contributor ID).

In some cultures, people may have just a single name, which is treated as the surname. This may contradict how the author’s culture feels about this, but the reason is purely functional: what matters is that an author is indexed under the surname; the first name may be abbreviated in the index or the running heads.

If the author is not a person, e.g. an institution or a government body, `<ce:author>` is also used, and the name is captured within `<ce:surname>`. This should not be confused with a named group of scientists, i.e. a collaboration, which is captured using `<ce:collaboration>`.

```xml
<ce:author>
  <ce:surname>Liszt</ce:surname>
  <ce:given-name>Ferenc</ce:given-name>
</ce:author>
<ce:author>
  <ce:surname>Govinda</ce:surname>
</ce:author>
<ce:author>
  <ce:surname>National Board of Transport Safety</ce:surname>
</ce:author>
<ce:author orcid="1234-5678-4321-8765">
  <ce:degrees>Prof.</ce:degrees>
  <ce:given-name>Elizabeth M.C.</ce:given-name>
  <ce:surname>Square</ce:surname>
  <ce:suffix>Sr.</ce:suffix>
  <ce:degrees>D.Phil. (Oxon)</ce:degrees>
  <ce:ranking>*</ce:ranking>
  <ce:roles>Chair, Royal Commission for Biomedical Research</ce:roles>
  <ce:cross-ref refid="aff1"><ce:sup>a</ce:sup></ce:cross-ref>
  <ce:cross-ref refid="aff5"><ce:sup>e</ce:sup></ce:cross-ref>
  <ce:cross-ref refid="fn2"><ce:sup>2</ce:sup></ce:cross-ref>
  <ce:e-address>emc.square@hotmail.com</ce:e-address>
  <ce:link locator="fx1"/>
</ce:author>
```

If the author is deceased, this cannot be indicated within `<ce:author>`; a footnote following the author is to be used.

If the author has only supplied initials instead of a full given name, then these are also captured in `<ce:given-name>`.

```xml
<ce:author>
  <ce:surname>Liszt</ce:surname>
  <ce:given-name>Ferenc</ce:given-name>
</ce:author>
```
In order to help applications to render the correct initials from a given name, the element <ce:initials> has been provided. If (and only if) the initials of the author cannot be inferred from the <ce:given-name> element by taking the first letter of each name, preserving dashes, the subelement <ce:initials> is used to capture the author’s correct initials. It is used for rendering author names with initials instead of full given names, e.g. in tables of contents and in running heads. Note that <ce:initials> does not replace <ce:given-name>.

XML

<ce:author biographicalid="bio2">
  <ce:initials>Ph.E.</ce:initials>
  <ce:given-name>Philippe E.</ce:given-name>
  <ce:surname>Shepherd</ce:surname>
</ce:author>

In order to help applications to correctly alphabetize a name, the element <ce:indexed-name> has been provided. If (and only if) it is common to alphabetize the name at a place which cannot be inferred from the <ce:surname>, the subelement <ce:indexed-name> is used. This is only for very exceptional cases, because it is assumed that indexing programs can cope with all names with accented characters.

XML

<ce:author>
  <ce:indexed-name>Gamma-Corporation</ce:indexed-name>
  <ce:surname>&Gamma;-Corporation</ce:surname>
</ce:author>

The element <ce:link> can be used to add a picture of the author. This should not be confused with a picture of the author within the biography.

Version history

Prior to DTD 5.0, this element was called au; it did not contain the initials or indexed name, cross-references and the electronic addresses at this level. The <author-id> attribute was added in CEP 1.1.0. Parameter entity %cross-ref; was introduced in CEP 1.1.2. In CEP 1.2.0 the attribute orcid was added, while element <ce:alt-name> was added to parameter entity %name;.

Model (CEP 1.2.0)

```xml
<!ELEMENT ce:author-group ( ( ce:collaboration | ce:author | ce:text )+, ce:affiliation*, ce:correspondence*, ce:footnote* )>
```

```xml
<!ATTLIST ce:author-group id ID #IMPLIED role CDATA #IMPLIED>
```

Description

The element `ce:author-group` contains authors and their affiliations.

Usage

The element `ce:author-group` is an important part of the head of an item. It contains a group of authors and/or collaborations with associated information. Some document types allow more than one author group; this is needed for implicit author–affiliation couplings (see below).

The element `ce:author-group` is also used in a structured list of editors of an issue, `ce:editors`, to capture a group of editors.

Each author group consists of a sequence of authors (`ce:author`) and/or collaborations (`ce:collaboration`), possibly interspersed with free text (`ce:text`). This is followed by a list of affiliations (`ce:affiliation`), correspondence information (`ce:correspondence`) and footnotes (`ce:footnote`).

The affiliation list contains all the affiliations in this author group. Each author or collaboration may either be coupled to several affiliations, or all authors share the same uncoupled affiliations. The authors and/or collaborations on the one hand and affiliations on the other hand can be related to each other in two ways.

- **Explicit.** The relationship between authors and affiliations is indicated by adding a `ce:cross-ref` element within `ce:author`, referring to an id of an affiliation. In this case, authors always require a `ce:cross-ref` to an affiliation; collaborations require an affiliation if there are no authors in the same author group. When using explicit coupling, it is allowed to have affiliations without associated authors or collaborations. It is not allowed to couple an author with an affiliation in another author group.
• *Implicit.* All authors in an author group are related to all affiliations present in that author group. Typically, but not necessarily, there will be only one affiliation in the author group. The authors do not have a `ce:cross-ref` element, and the affiliations do not need a `ce:label` subelement.

Especially for the editors of an issue it may occur that some, or usually all, editors are listed without affiliation. In such a case it is important not to create unnecessary `ce:author-group`s. The following rule must be applied: consecutive authors or editors without an affiliation must be captured in a single `ce:author-group`.

The following example shows *explicit* author-affiliation coupling.

**XML**

```xml
<ce:author-group id="aug1">
  <ce:author id="au1" biographyid="vt1">
    <ce:given-name>J.J.</ce:given-name>
    <ce:surname>Niemela</ce:surname>
    <ce:ranking>*</ce:ranking>
    <ce:cross-ref id="cr1" refid="aff1"><ce:sup>a</ce:sup></ce:cross-ref>
    <ce:cross-ref id="cr2" refid="fn1"><ce:sup>1</ce:sup></ce:cross-ref>
  </ce:author>
  <ce:author id="au2" biographyid="vt2">
    <ce:given-name>K.R.</ce:given-name>
    <ce:surname>Sreenivasan</ce:surname>
    <ce:cross-ref id="cr3" refid="aff1"><ce:sup>a</ce:sup></ce:cross-ref>
    <ce:cross-ref id="cr4" refid="aff2"><ce:sup>b</ce:sup></ce:cross-ref>
  </ce:author>
  <ce:author id="au3">
    <ce:given-name>R.J.</ce:given-name>
    <ce:surname>Donnelly</ce:surname>
    <ce:cross-ref id="cr5" refid="aff1"><ce:sup>a</ce:sup></ce:cross-ref>
    <ce:cross-ref id="cr6" refid="cor1"><ce:sup>&#x0204E;</ce:sup></ce:cross-ref>
    <ce:e-address>russ@vortex.uoregon.edu</ce:e-address>
  </ce:author>
  <ce:affiliation id="aff1">
    <ce:label>a</ce:label>
    <ce:addressfn>Cryogenic Helium Turbulence Laboratory, Department of Physics, University of Oregon, Eugene, OR 97403, USA</ce:addressfn>
  </ce:affiliation>
  <ce:affiliation id="aff2">
    <ce:label>b</ce:label>
    <ce:addressfn>Mason Laboratory, Yale University, New Haven, CT 06520-8286, USA</ce:addressfn>
  </ce:affiliation>
  <ce:correspondence id="cor1">
    <ce:label>&#x0204E;</ce:label>
    <ce:text>Correspondence and requests for materials should be addressed to R.J. Donnelly.</ce:text>
  </ce:correspondence>
  <ce:footnote id="fn1">
    <ce:label>1</ce:label>
    <ce:note-para>Supported by NSF Grant ...</ce:note-para>
  </ce:footnote>
</ce:author-group>
```
The following example is an example of implicit author–affiliation coupling. Unlike the previous example, there are no labels “a” and “b” that make the coupling explicit. All the authors in the author group belong to the affiliation in this author group.

XML

```xml
<ce:author-group id="aug2">
  <ce:author id="au4">
    <ce:given-name>Akira</ce:given-name>
    <ce:surname>Hirose</ce:surname>
  </ce:author>
  <ce:author id="au5">
    <ce:given-name>Hirofumi</ce:given-name>
    <ce:surname>Onishi</ce:surname>
  </ce:author>
  <ce:affiliation id="aff3">
    <ce:textfn>Research Center for Advanced Science and Technology (RCAST), The University of Tokyo, 4-6-1 Komaba, Meguro-ku, Tokyo 153, Japan</ce:textfn>
  </ce:affiliation>
</ce:author-group>
```

Presentation

Akira Hirose and Hirofumi Onishi

Research Center for Advanced Science and Technology (RCAST), The University of Tokyo, 4-6-1 Komaba, Meguro-ku, Tokyo 153, Japan

The element `ce:text` is an elementary way to add text before, in between and after author names.

XML

```xml
<ce:author-group id="aug3">
  <ce:author id="au6">
    <ce:given-name>R.</ce:given-name>
    <ce:surname>Glynn-Jones</ce:surname>
  </ce:author>
  <ce:affiliation id="aff4">
    <ce:collaboration id="cl1">
      <ce:text>Colorectal Cancer Annual Consensus Meeting Group</ce:text>
    </ce:collaboration>
    <ce:affiliation id="aff4">
      <ce:label>a</ce:label>
      <ce:textfn>Mount Vernon Cancer Centre, Rickmansworth Road, Northwood HA6 2HN, UK</ce:textfn>
    </ce:affiliation>
  </ce:affiliation>
</ce:author-group>
```
Presentation
R. Glynn Jones* on behalf of the Colorectal Cancer Annual Consensus Meeting Group
*Mount Vernon Cancer Centre, Rickmansworth Road, Northwood HA6 2RN, UK

Version history
In CEP 1.1.6, subelement ce:text was added to the content model and the attribute role was added. The id attribute was added in CEP 1.2.0.

ce:editors
ce:bibliography

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:bibliography ( ce:section-title, ce:bibliography-sec+ )>
<!ATTLIST ce:bibliography
    id ID #IMPLIED
    role CDATA #IMPLIED
    view %view; 'all'>
```

Description

The element `ce:bibliography` is used for the reference list of a document.

Usage

The element `ce:bibliography` contains bibliographic references of the document. It can consists of several subsections, `ce:bibliography-sec`. Often there is just one reference list, in which case the bibliography contains only one `ce:bibliography-sec` without a `ce:section-title`. Each `ce:bibliography-sec` except the first must have a `ce:section-title`, for the first this is optional.

The subelement `ce:section-title` of `ce:bibliography` contains the name of the bibliography, e.g. “References” or “Bibliography”.

Each `ce:bibliography-sec` contains one or more bibliographic references, `ce: bib-reference`. Each `ce:bib-reference` must be referred to by means of `ce:cross-ref`. References which are not being referred to, may find a place in the further-reading list, `ce:further-reading`.

Version history

Prior to DTD 5.0, the element `bibl` contained the bibliographic references. It is comparable to `ce:bibliography-sec`, and `ce:bibliography` is a container of the bibliography sections. The `view` attribute was added in CEP 1.1.0.

Light reading

`ce:bibliography` is part of HEAD-AND-TAIL material.

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
**ce:bibliography-sec**

**Declaration**

**Model (CEPs 1.1.0–1.1.5)**

```xml
<!ELEMENT ce:bibliography-sec ( ce:section-title?, ce:bib-reference+ )>
<!ATTLIST ce:bibliography-sec
  id ID #IMPLIED
  role CDATA #IMPLIED>
```

**Model (CEPs 1.1.6, 1.2.0)**

```xml
<!ELEMENT ce:bibliography-sec ( ce:section-title?, ce:bib-reference+ )>
<!ATTLIST ce:bibliography-sec
  id ID #IMPLIED
  role CDATA #IMPLIED
  view %view; 'all'>
```

**Description**

The element `ce:bibliography-sec` is a section within the bibliographic references.

**Usage**

See `ce:bibliography`.

**Version history**

The `view` attribute was added in CEP 1.1.6.
ce:bib-reference

Declaration

Model (CEPs 1.1.0–1.1.5)

<!ATTLIST ce:bib-reference
id ID #REQUIRED>

Model (CEPs 1.1.6, 1.2.0)

<!ATTLIST ce:bib-reference
id ID #REQUIRED
role CDATA #IMPLIED>

Description

The element ce:bib-reference is used to capture a bibliographic reference within the reference list or within the further-reading section.

Usage

Each entry in a list of bibliographic references (ce:bibliography) or a further-reading list (ce:further-reading) is a ce:bib-reference.

The ce:bib-reference may be either just a ce:note (an endnote), or a sequence of one or more bibliographic references followed by a ce:note. The core of each bibliographic reference is a structured reference (sb:reference) or an unstructured reference (ce:other-ref).

The ce:bib-reference must have an id attribute and a ce:label subelement. For numbered references, the ce:label contains the number (no punctuation is generated by this instance of ce:label) and for name/date references it contains name and date in the way the reference is referred to in the text without parentheses. Several possible formats are shown below. Note in particular the full stop in the second example and the “1999a” in the fifth example.

XML

<ce:bib-reference id="bib37"><ce:label>[37]</ce:label>
<ce:bib-reference id="bib37"><ce:label>[37]</ce:label>
<ce:bib-reference id="bib37"><ce:label>[Go78]</ce:label>
<ce:bib-reference id="bib37"><ce:label>Bohm et al., 1999</ce:label>
<ce:bib-reference id="bib37"><ce:label>Bohm et al., 1999a</ce:label>

Name/date references

In case of the name/date referencing style the bibliographic references are printed without a label before the reference, and thus their ce:label element is not shown, and may seem irrelevant. However, in name/date references with the same authors and the same year, the “a” and “b” after the year is stored within the ce:label element. This is the only place where the “a” or “b” can be found; the sb:date does not contain it as it is not a property of the reference but of the document in which the reference appears.
Moreover, some publications may choose to show the \code{ce:label} element in their presentation. One case in which this happens in almost all applications, is when a reference is one of the targets in a one-to-many cross-reference. In electronic publications such a one-to-many cross-reference may be represented with a “drop-down menu”, which is built up via the \code{ce:label} elements of the targets (see the section Cross-references and the label element, p. 167).

**XML**

```xml
<ce:bib-reference id="bib12">
  <ce:label>Sheen, 1999a</ce:label>
  <sb:reference>
    <sb:contribution>
      <sb:authors>
        <sb:author>
          <ce:given-name>J.</ce:given-name>
          <ce:surname>Sheen</ce:surname>
        </sb:author>
      </sb:authors>
      <sb:title>
        C<ce:inf>4</ce:inf> gene expression
      </sb:title>
    </sb:contribution>
    <sb:host>
      <sb:issue>
        <sb:series>
        </sb:series>
        <sb:volume-nr>50</sb:volume-nr>
      </sb:issue>
      <sb:date>1999</sb:date>
      <sb:pages>
        <sb:first-page>187</sb:first-page>
        <sb:last-page>217</sb:last-page>
      </sb:pages>
    </sb:host>
  </sb:reference>
</ce:bib-reference>
```

**Presentation**

**Multiple bibliographic references in one \code{ce:bib-reference} element**

It is possible to group more than one bibliographic reference within a \code{ce:bib-reference} element. These may be a mixed sequence of structured and unstructured references.

When one or more of the references in the \code{ce:bib-reference} element are cited individually, they \textit{all} need to have a \code{ce:label} element, and at least the ones cited individually need to have an \code{id} attribute. When there is a single reference in a \code{ce:bib-reference} element, this single reference (\code{sb:reference} or \code{ce:other-ref}) is not allowed to have a \code{ce:label} element and an \code{id} attribute.

For cross-references to a \code{sb:reference} element, see the section Cross-references and the
XML

<ce:bib-reference id="bib1">
  <ce:label>[1]</ce:label>
  <ce:other-ref>
  </ce:other-ref>
</ce:bib-reference>

Presentation

XML

<ce:bib-reference id="bib2">
  <ce:other-ref id="or2a">
    <ce:label>(a)</ce:label>
  </ce:other-ref>
  <ce:other-ref id="or2b">
    <ce:label>(b)</ce:label>
  </ce:other-ref>
</ce:bib-reference>

Presentation

...

With the name/date referencing style, grouping of several `sb:reference` or `ce:other-ref` elements is discouraged.

**Version history**

Prior to DTD 5.0, this element was called `bib`.

**Light reading**

In HEAD-AND-TAIL SGML files, `ce:bib-references` need not be referred to.

**Known bugs, hacks and problems**

It is not possible to have a comment to a multiple reference.

**See also**

Structured references are explained in more detail in the section Bibliographic references (p. 426). The `role` attribute was added in CEP 1.1.6.
ce:biography

Declaration

Model (CEPs 1.1.0–1.1.5)

```xml
<!ELEMENT ce:biography ( ce:link?, ce:simple-para+ )>
<!ATTLIST ce:biography
 id ID #IMPLIED
 view %view; 'all'>
```

Model (CEPs 1.1.6, 1.2.0)

```xml
<!ELEMENT ce:biography ( ce:link?, ce:simple-para+ )>
<!ATTLIST ce:biography
 id ID #IMPLIED
 role CDATA #IMPLIED
 view %view; 'all'>
```

Description

Some journals publish short biographies in their articles. The element `ce:biography` is used for this purpose.

Usage

The biography element `ce:biography` contains a short biography of a person, mostly the author in the form of one or more “simple” paragraphs, `ce:simple-para`. It has an `id`; the link with the author is established through the `biographyid` attribute of `ce:author`. It is also possible to link a name in the text to a `ce:biography` via a `ce:cross-ref`.

If the biography contains a photograph of the author, the first subelement `ce:link` is used to reference the file containing the photograph. It is not appropriate to use `ce:inline-figure` for the photograph.

XML

```xml
<!--ENTITY fx1 SYSTEM "fx1" NDATA IMAGE>
...
<ce:biography id="bio1">
<ce:link locator="fx1"/>
<ce:simple-para id="spS8"><ce:bold>Stephen Hawking</ce:bold> holds the chair once held by Isaac Newton as Lucasian Professor in Mathematics at the University of Cambridge...<ce:simple-para>
</ce:biography>
```

In some journals or books there are no biographies, but a picture of each author is displayed near the author’s name in the document head. For this, `ce:link` in `ce:author` is used.

Version history

Prior to DTD 5.0, this element was called `vt`. Then it did not contain the `ce:link` subelement; the graphic file was associated to the biography with an attribute. The `view` attribute was added in CEP 1.1.0. The `role` attribute was added in CEP 1.1.6.
ce:bold

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT ce:bold ( %richstring.data; )*>

Description

The element ce:bold is a font changing element (p. 171). It is used to obtain bold.

Usage

XML
<ce:bold>This text is in bold</ce:bold>
Presentation
This text is in bold

Version history

Prior to DTD 5.0, this element was called b.

See also

For more information see the section on text effects (p. 171). See also ce:cross-out, ce:italic, ce:monospace, ce:sans-serif, ce:small-caps, ce:underline.
**ce:br**

**Declaration**

**Model (CEPs 1.1.2–1.2.0)**

```xml
<!ELEMENT ce:br EMPTY>
```

**Description**

The element `ce:br` is used to create an explicit line break.

**Usage**

If the need arises to indicate an explicit line break `ce:br` can be used within certain context, e.g. within a table cell.

**XML**

```xml
...<row>
   <entry>Dairy</entry>
   <entry>8 oz milk<ce:br/>8 oz cottage cheese<ce:br/>8 oz ice cream<ce:br/>1 oz hard cheese<ce:br/>1 cup yogurt</entry>
   <entry>6 servings per day</entry>
   <entry>8 servings per day</entry>
   <entry>10 servings per day</entry>
   <entry>12 servings per day</entry>
</row>
...```

**Presentation**

**Menu Guidelines**

<table>
<thead>
<tr>
<th>Food group</th>
<th>Serving size</th>
<th>Singleton</th>
<th>Twins</th>
<th>Triples</th>
<th>Quads</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dairy</td>
<td>8 oz milk</td>
<td>6 servings</td>
<td>8 servings</td>
<td>10 servings</td>
<td>12 servings</td>
</tr>
<tr>
<td></td>
<td>8 oz cottage cheese</td>
<td>per day</td>
<td>per day</td>
<td>per day</td>
<td>per day</td>
</tr>
<tr>
<td></td>
<td>8 oz ice cream</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>1 oz hard cheese</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>1 cup yogurt</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Explanation**

The line breaks in the second column are a result of the use of element `ce:br` whereas the line breaks in columns 3–6 are created by the rendering application. Note that in the above XML example the header rows are omitted for brevity.

**Version history**

This element was introduced in CEP 1.1.2.
ce:caption

Declaration

Model (CEPs 1.1.0–1.1.1)

<!ELEMENT ce:caption ( ce:simple-para+ )>

Model (CEPs 1.1.2–1.1.5)

<!ELEMENT ce:caption ( ce:simple-para+ )>
<!ATTLIST ce:caption
role CDATA #IMPLIED
xml:lang %iso639; #IMPLIED>

Model (CEPs 1.1.6, 1.2.0)

<!ELEMENT ce:caption ( ce:simple-para+ )>
<!ATTLIST ce:caption
id ID #IMPLIED
role CDATA #IMPLIED
xml:lang %iso639; #IMPLIED>

Description

Captions are tagged with ce:caption.

Usage

Figures, tables, e-components and textboxes possess captions, structured with ce:caption, that give a description of the object. A ce:caption consists of one or more simple paragraphs, ce:simple-para.

The attribute xml:lang, with values in the ISO 639 set of entities (p. 178), indicates the language of the caption, by default the language of the document. This is to support publications that publish captions in different languages.

The attribute role allows one to categorize captions. For instance, it makes it possible to mark a caption as “title” and handle it different from ordinary captions. Applications should treat captions with roles unknown to them as ordinary captions, i.e., unknown roles must be ignored. The role must belong to a list validated by the XML validation tools. The following value for role has been defined:

• title is used to mark the caption as the title of the figure, table or textbox.

Version history

The xml:lang and role attributes were added in CEP 1.1.2. The id attribute was added in CEP 1.1.6.

ce:alt-e-component, ce:e-component, ce:figure, ce:table, ce:textbox
Chapter 8 – The Elements of the CEP

**ce:chem**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT ce:chem ( %textfn.data; )*>
```

**Description**

A displayed chemical formula is captured using **ce:chem**.

**Usage**

The element **ce:chem** is one of the possible subelements of **ce:formula**. It contains the text of the chemical formula to be displayed. The equation number is separately captured in the **ce:label** child element of the **ce:formula** parent.

```xml
<ce:formula id="ch2">
  <ce:label>(2)</ce:label>
  <ce:chem>TLC (CH<ce:inf>2</ce:inf>C<ce:inf>l2</ce:inf>/MeOH): R<ce:it>f=0.45; IR: 3423 cm<ce:sup>-1</ce:sup> (NH).</ce:chem>
</ce:formula>
```

Inline chemical formulae may be entered as part of the running text, without a special tag.

**Version history**

Prior to DTD 5.0, both displayed mathematical and displayed chemical formulae were captured in the element **fd**.

**Rendering notes**

The content is rendered within the formula area of **ce:formula**, possibly followed by the equation number.
ce:collab-aff

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:collab-aff ( %text.data; )*>

Description

The element ce:collab-aff adds an affiliation-like phrase to a collaboration.

Usage

See ce:collaboration.
ce:collaboration

Declaration

Model (CEPs 1.1.0–1.1.1)

```xml
<!ELEMENT ce:collaboration (ce:indexed-name?, ce:text, ce:cross-ref*, ce:collab-aff?)>
<!ATTLIST ce:collaboration id ID #IMPLIED
role CDATA #IMPLIED>
```

Model (CEPs 1.1.2–1.1.6)

```xml
<!ELEMENT ce:collaboration (ce:indexed-name?, ce:text, (%cross-ref;)*, ce:collab-aff?)>
<!ATTLIST ce:collaboration id ID #IMPLIED
role CDATA #IMPLIED>
```

Model (CEP 1.2.0)

```xml
<!ELEMENT ce:collaboration (ce:indexed-name?, ce:text, (%cross-ref;)*, ce:collab-aff?, ce:e-address*, ce:author-group*)>
<!ATTLIST ce:collaboration id ID #IMPLIED
role CDATA #IMPLIED>
```

Description

The name of a collaboration is captured in the `ce:collaboration` element.

Usage

A collaboration denotes a group of authors who present themselves under a common name: the collaboration name. The element `ce:collaboration` is used to capture such a collaboration. It contains an optional name under which the collaboration should appear in an index (`ce:indexed-name`), a container for the actual name (`ce:text`), optional cross-references to affiliations or footnotes (`ce:cross-ref`), an optional collaboration affiliation (`ce:collab-aff`), a number of electronic addresses of the collaboration (`ce:e-address`), and nested author groups for capturing the members of the collaboration (`ce:author-group`).

```xml
<ce:collaboration id="coll1">
  <ce:text>ALPHA Collaboration</ce:text>
  <ce:cross-ref id="cr1" refid="fn1"><sup>1</sup></ce:cross-ref>
</ce:collaboration>
...<ce:footnote id="fn1">
  <ce:label>1</ce:label>
  <ce:note-para id="np1">Operated by the Universities of ...</ce:note-para>
</ce:footnote>
```
Chapter 8 – The Elements of the CEP

The collaboration name can be used in an author group `ce:author-group` instead of or in addition to the names of one or more of its member authors. A `ce:collaboration` element can be the only element in an author group, or its author group can contain the names of other collaborations and the names of individual authors.

XML

```xml
<ce:author-group id="aug1">
  <ce:author id="au1">
    <ce:given-name>Th.J.</ce:given-name>
    <ce:surname>Jansen</ce:surname>
  </ce:author>
  <ce:text>for</ce:text>
  <ce:collaboration id="coll2">
    <ce:text>The ISOLDE Collaboration</ce:text>
    <ce:collab-aff>Cryogenic Helium Turbulence Laboratory ...</ce:collab-aff>
  </ce:collaboration>
</ce:author-group>
```

Presentation

Th.J. Jansen for The ISOLDE Collaboration

If (and only if) it is common to alphabetize the name at a place which cannot be inferred from the `ce:collaboration`, the subelement `ce:indexed-name` is used. This is only for very exceptional cases, because it is assumed that indexing programs can cope with all names with accented characters.

XML

```xml
<ce:collaboration id="coll3">
  <ce:indexed-name>Alpha Collaboration</ce:indexed-name>
  <ce:text>\&alpha; Collaboration</ce:text>
</ce:collaboration>
```

Sometimes a collaboration adds an affiliation-like phrase to its name. This can be captured in the `ce:collab-aff` element.

XML

```xml
<ce:collaboration id="coll4">
  <ce:text>ALPHA Collaboration</ce:text>
  <ce:collab-aff>Stockholm–London–Amsterdam</ce:collab-aff>
</ce:collaboration>
```

Presentation

ALPHA Collaboration

Stockholm–London–Amsterdam

The members of a collaboration can be captured with one or more `ce:author-groups`. These author groups can contain affiliations but may not contain other collaborations.

XML

```xml
<ce:collaboration id="coll5">
  <ce:text>NEMO-3 Collaboration</ce:text>
  <ce:author-group id="aug2">
    <ce:author id="au2">
      <ce:given-name>J.</ce:given-name>
      <ce:surname>Argyiades</ce:surname>
      <ce:cross-ref refid="aff1">...</ce:cross-ref>
    </ce:author>
  </ce:author-group>
</ce:collaboration>
```
A collaboration should not be confused with a non-person author (captured using ce:surname).

**Version history**

Parameter entity `%cross-ref`; was introduced in CEP 1.1.2. Subelements ce:e-address and ce:author-group were added in CEP 1.2.0.

**See also**

ce:author, ce:author-group, ce:collab-aff, ce:indexed-name
ce:compound-formula

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT ce:compound-formula ( %text.data; )*>

Description

The formula of a chemical compound within a stereochemistry abstract is captured using ce:compound-formula.

Usage

See ce:stereochem.

Version history

Prior to DTD 5.0, this element was called compound-f.
ce:compound-info

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:compound-info (ce:list-item*)>

Description

Part of a stereochemistry abstract is additional itemized information about a chemical compound. The element ce:compound-info provides a way to capture this.

Usage

See ce:stereochem.
ce:compound-name

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT ce:compound-name ( %text.data; )*>

Description

The name of a chemical compound within a stereochemistry abstract is captured using ce:compound-name.

Usage

See ce:stereochem.
**ce:compound-struct**

**Declaration**

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:compound-struct ( ce:link )>
```

**Description**

The purpose of the element `ce:compound-struct`, part of a stereochemistry abstract, is to provide a link to a graphic file showing a chemical structure.

**Usage**

See `ce:stereochem`. 
ce:copyright

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:copyright ( %string.data; )*>
<!ATTLIST ce:copyright
type %copyright-type; #REQUIRED
year NMTOKEN #REQUIRED>

Description

The element ce:copyright contains information about the copyright owner of the document, or of a component of the document.

Usage

The element ce:copyright is used to capture the copyright holder and status of an item. As an optional element within ce:figure, ce:textbox and ce:e-component, it can also be used to indicate the copyright holder of such an object.

It has two mandatory attributes, type and year. The latter contains the copyright year while the former, which takes its values in %copyright-type;, contains the copyright status, indicated by the following values (the copyright statuses refer to [20]):

- crown is used when the author claims Crown copyright. [Copyright status: 004.]
- free-of-copyright: this value is used when the item has no copyright, for example in case of an index. [Copyright status: 000.]
- full-transfer: this value is used when a full transfer to one of the publisher’s companies has been received. [Copyright status: 002.]
- joint is used when a full transfer has been received for an article in a journal whose copyright is owned jointly by one of the publisher’s companies and a society. [Copyright status: 002.]
- limited-transfer is used when the author has granted only limited rights; special care must be taken for its production. [Copyright status: 005.]
- no-transfer is used when there is an unresolvable copyright problem and the article may not be published (in principle, documents with this copyright status cannot occur). This should not be confused with copyright status 001, when copyright has not yet been transferred. Within ce:figure, ce:textbox or ce:e-component it is used to signal that the object may not appear online. [Copyright status: 007.]
- other is used when copyright owner is different from the journal’s copyright owner, e.g. the authors or their employing institutions. This copyright type is also used in the ce:copyright within a ce:figure, ce:textbox or ce:e-component. [Copyright status: 006.]
- society is used when a full transfer has been received for an article in a journal whose copyright is owned by a society. [Copyright status: 002.]
- unknown: this value is used when the article may be published but the actual status is unknown. This is, for instance, the case when the copyright transfer form has not yet been received from the author. [Copyright status: 001.]
us-gov is used when the author is a US government employee and will not transfer copyright. [Copyright status: 003.]

The content of ce:copyright is the copyright holder. Only if the value of type is crown, no-transfer, other, unknown or us-gov, may the content be empty.

The presentation of the copyright notice of an article depends on (i) the article’s copyright status, (ii) the content of the ce:copyright element, and (iii) the base data of the journal or book, in particular its copyright owner. It is explained in full detail in [21]. Some examples are given below.

**XML**

```xml
<ce:copyright type="full-transfer" year="2012">Elsevier Ireland Ltd</ce:copyright>
<ce:copyright type="society" year="2012">Society of Cardiology</ce:copyright>
<ce:copyright type="unknown" year="2012"></ce:copyright>
```

**Presentation**

© 2012 Elsevier Ireland Ltd. All rights reserved.
© 2012 Society of Cardiology. Published by Elsevier Inc. All rights reserved.
© 2012 Published by Elsevier B.V.

**Explanation**

Note that in the second example, the publishing company is inferred from the base data, it is not present in the XML file. Moreover, in the third example, the “published by” information is also inferred from the journal base data. The text would be different if the journal’s copyright holder is not one of the publisher’s companies.

**Version history**

In CEP 1.2.0 value free-of-copyright was added to entity %copyright-type;.

**See also**

ce:copyright-line
ce:copyright-line

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:copyright-line ( %richstring.data; )*>

Description

The element ce:copyright-line contains verbatim text to be used as copyright line.

Usage

The element ce:copyright-line contains verbatim text to be used as copyright line. It is used in the Elsevier Book DTDs, in the journal Article DTD as of version 5.2.0 and in DTDs where the copyright statuses as defined in ce:copyright are not (yet) applicable. It is generated from the ce:copyright element.

XML

<ce:copyright-line>© 2013 Elsevier B.V.</ce:copyright-line>

Version history

This element was introduced in CEP 1.1.0.
ce:correspondence

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:correspondence ( ce:label, ce:text )>
<!ATTLIST ce:correspondence
  id ID #REQUIRED>
```

Description

The element `ce:correspondence` is used to indicate the corresponding author or authors, and possibly the correspondence address.

Usage

The element `ce:correspondence` is used to indicate that each author linked to it is a corresponding author. The link is established through a `ce:cross-ref` within `ce:author`, and it must be the target of at least one such cross-reference. To this end, the element `ce:correspondence` has an `id` attribute and a `ce:label` subelement — the latter contains the symbol displayed at the footnote.

It is also possible to have several corresponding authors, each with their own `id` and `ce:label` element.

The content can be merely “Corresponding author.” or it can contain the correspondence address, which might differ from the author’s affiliation.

```xml
<ce:correspondence id="cor1">
  <ce:label>&#x0204E;</ce:label>
  <ce:text>Correspondence to: R. Schrauwen, VP,
  Content Standards and Processes, Elsevier,
  Radarweg 29, 1043 NX Amsterdam, The Netherlands.
  Tel.: +31 20 4852408; fax: +31 20 4853266.</ce:text>
</ce:correspondence>
```

See also

`ce:author-group`
**ce:cross-out**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT ce:cross-out ( %richstring.data; )*>
```

**Description**

The element **ce:cross-out** is related to the font changing elements (p. 171). It is used to obtain crossed-out text.

**Usage**

To obtain crossed-out (strike-through) text, use **ce:cross-out**.

**XML**

```xml
<ce:cross-out>This text is crossed-out</ce:cross-out>
```

**Presentation**

This text is crossed-out

**See also**

For more information see the section on **text effects** (p. 171). See also **ce:bold, ce:italic, ce:monospace, ce:sans-serif, ce:small-caps, ce:underline**.
ce:cross-ref

Declaration

Model (CEPs 1.1.0–1.1.6)

```xml
<!ELEMENT ce:cross-ref ( %text.data; )*>
<!ATTLIST ce:cross-ref refid IDREF #REQUIRED>
```

Model (CEP 1.2.0)

```xml
<!ELEMENT ce:cross-ref ( %text.data; )*>
<!ATTLIST ce:cross-ref id ID #IMPLIED refid IDREF #REQUIRED>
```

Description

Simple cross-references to targets within the same document instance are tagged using `ce:cross-ref`.

Usage

A cross-reference is a reference to another element in the document instance. The mandatory attribute `refid` contains a valid ID.

XML

```xml
see <ce:cross-ref refid="tbl4">Table 4</ce:cross-ref>
according to <ce:cross-ref refid="enum7">Lemma 1.6</ce:cross-ref>
in (<ce:cross-ref refid="bib37">Smith et al., 1998</ce:cross-ref>)
<ce:cross-ref refid="fn2"><ce:sup>2</ce:sup></ce:cross-ref>
```

Presentation

```xml
see Table 4
according to Lemma 1.6
in (Smith et al., 1998)
```

The content of `ce:cross-ref` is popularly referred to as “the text to click on”. In an electronic rendering, clicking on the text immediately leads to the destination. The content is the full designation of the destination, e.g. "Fig. 4" rather than "4". Presentation, such as superior for a reference to a footnote, is tagged explicitly.

The element `ce:cross-ref` may be empty. This can happen, for instance, in a glossary or index. The rendering application must then provide another way to reach the destination.

Version history

In DTD 4, the element `cross-ref` allows one-to-many links. The new element `ce:cross-ref` has been introduced for that purpose. The `id` attribute was added in CEP 1.2.0.

Rendering notes

Element `ce:cross-ref` has no influence on where its target appears in the paper or online versions. For instance, float placement is arranged using `ce:float-anchor`; where the `ce:cross-ref` that points to the float appears is immaterial.
Copy edit considerations

It sometimes happens that cross-references, especially to bibliographic references, only appear within artwork. It is then required to change the text, e.g. the figure caption, in such a way that the object can be referred to using `ce:cross-ref`.

See also

For more information, see the section Cross-references and the label element (p. 167), as well as the elements `ce:cross-refs`, `ce:intra-ref`, `ce:intra-refs`, `ce:inter-ref`, `ce:inter-refs`. 
ce:cross-refs

Declaration

Model (CEPs 1.1.0–1.1.6)

```xml
<!ELEMENT ce:cross-refs ( %text.data; )*>
<!ATTLIST ce:cross-refs
  refid IDREFS #REQUIRED>
```

Model (CEP 1.2.0)

```xml
<!ELEMENT ce:cross-refs ( %text.data; )*>
<!ATTLIST ce:cross-refs
  id ID #IMPLIED
  refid IDREFS #REQUIRED>
```

Description

Extended cross-references to multiple targets within the same document instance are tagged using `ce:cross-refs`.

Usage

An extended cross-reference is a reference to several other elements in the document instance. The mandatory attribute `refid` contains a list of valid IDs. There must be more than one target; for single targets `ce:cross-ref` is used.

**XML**

```xml
see <ce:cross-refs refid="tbl4 tbl5">Tables 4 and 5</ce:cross-refs>
see <ce:cross-refs refid="pl2 pl3 pl4">Plates II–IV</ce:cross-refs>
in <ce:cross-refs refid="bib1 bib2 bib3">[1–3]</ce:cross-refs>
in (<ce:cross-refs refid="bib19 bib20">Jones, 2001a,b</ce:cross-refs>)
```

**Presentation**

see Tables 4 and 5
see Plates II–IV
in [1–3]
in (Jones, 2001a,b)

The content is the full designation of the destination, e.g. “Figs. 4 and 5” or “Tables 7–10”. Presentation, such as superior for a reference to a footnote, is tagged explicitly.

Due to the one-to-many nature of `ce:cross-refs`, it is a complicated element. The content of `ce:cross-refs` is popularly referred to as “the text to click on”. When users click on this text, the rendering application may provide the user with a list of the targets that this `ce:cross-refs` points to. An important role is played by the `ce:label` elements of the destinations, that can be used to construct such a list. For more information, see the section Cross-references and the label element (p. 167).

The element `ce:cross-refs` may be empty. This can happen, for instance, in a glossary or index. The rendering application must then provide another way to reach the destination.

1. In XML files used for online rendering, it is possible to convert `ce:cross-refs` to the XLink-compliant `ce:intra-refs`, which already contains the designations of the targets.

**Version history**

In DTD 4, the element `cross-ref` was used for both one-to-one and one-to-many links. The element `ce:cross-ref` now only allows one-to-one links. The `id` attribute was added in CEP 1.2.0.

**Copy edit considerations**

It sometimes happens that cross-references, especially to bibliographic references, only appear within artwork. It is then required to change the text, e.g. the figure caption, in such a way that the object can be referred to using `ce:cross-ref`.

**Rendering notes**

This section deals with the *online* rendering of one-to-many links.

Rendering one-to-many links is, of course, cumbersome. In the PDF rendering, the content of `ce:cross-refs` is displayed, and a link to only the first destination is made. In an online rendering, this is inadequate. An important role is played by the `ce:label` element of the target. These labels are used to create a drop-down menu of targets, or they are rendered sequentially in-line.

Since the inline representation is the most popular, we describe it in more detail here.

**XML**

```
<ce:cross-refs refid="bib7 bib8 bib9 bib10">[7&ndash;10]</ce:cross-refs>
```

**Presentation**

see Refs. [7], [8], [9], and [10] for more information.

**Explanation**

The hyperlinks to the four bibliographic references are *not* created by examining the content of the `ce:cross-refs` element, but by pulling out the content of the `ce:label` elements of the targets. The content of `ce:cross-refs` is in fact a collapsed version of these `ce:labels`.

It is wrong to examine the content of the element `ce:cross-refs` and to build logic for expanding the text. A situation that is not uncommon is that an author refers to five chemical reactions (21)–(25), but that three of them are actually presented on a graphic, say Scheme VII. Since these are not coded in XML, it is impossible to refer to the individual reactions. This is done as follows.

**XML**

```
... reactions <ce:cross-refs refid="f21 sc7 f25">(21)&ndash;(25)</ce:cross-refs> ...
```

**Presentation**

... reactions (21), Scheme VII, (25) ...

**Explanation**

The `ce:label` elements of the targets lead the reader to the correct destination.

---

2. Note that this is a simplification, used for brevity. In truth, the section title or other portions of the destination also play a role. This is explained in the section *Cross-references and the label element* (p. 167). In this section we talk about the `ce:label` element to explain the general concept.
It is difficult to construct a sentence that works well with the content of ce:cross-refts as well as with the expansion of all the ce:labels of the target objects. For instance, suppose that the text contains “... in Figs. 4(a) and 5(b)–(d) ...” while the labels are “Fig. 4” and “Fig. 5”, then the way described above to construct the online sentence loses crucial information about which subfigures are meant. In such cases the use of ce:cross-ref is preferred.

See also

For more information, see the section Cross-references and the label element (p. 167), as well as the elements ce:cross-refts, ce:intra-ref, ce:intra-refts, ce:inter-ref, ce:inter-refts.
**ce:date-accepted**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT ce:date-accepted EMPTY>
<!ATTLIST ce:date-accepted
day NMTOKEN #IMPLIED
month NMTOKEN #REQUIRED
year NMTOKEN #REQUIRED>
```

**Description**

The **ce:date-accepted** element is used to capture the acceptance date of the article. It is an optional, empty element within the frontmatter.

**Usage**

Three attributes, `day`, `month`, `year` are used to store the day, month and year respectively. The latter two attributes are mandatory. The values are numbers, not padded with zero.

**XML**

```xml
<ce:date-accepted day="29" month="2" year="2000"/>
```

**Presentation**

Accepted 29 February 2000

**XML**

```xml
<ce:date-accepted month="8" year="2002"/>
```

**Presentation**

Accepted August 2002

**Version history**

In DTDs prior to DTD 5.0, this element was called `acc`.

ce:dedication

Declaration

Model (CEPs 1.1.0–1.1.5)

```xml
<!ELEMENT ce:dedication ( %textfn.data; )*>
```

Model (CEP 1.1.6)

```xml
<!ELEMENT ce:dedication ( %textfn.data; )*>
<!ATTLIST ce:dedication role CDATA #IMPLIED>
```

Model (CEP 1.2.0)

```xml
<!ELEMENT ce:dedication ( %textfn.data; )*>
<!ATTLIST ce:dedication id ID #IMPLIED
role CDATA #IMPLIED>
```

Description

A dedication within the head of an article is captured using `ce:dedication`.

Usage

The element `ce:dedication` is an optional subelement of the head of a document. It contains the full text of a dedication.

```
<ce:dedication id="ded23">Dedicated to Professor C. Böhm on the occasion of his 60th birthday.</ce:dedication>
```

Version history

Prior to DTD 5.0, this element was called `ded`. The `role` attribute was added in CEP 1.1.6, while the `id` attribute was added in CEP 1.2.0.

Rendering notes

The text “Dedicated to” is not generated.
ce:define-description

Declaration

Model (CEPs 1.1.0–1.1.6)
<!ELEMENT ce:define-description ( ce:para+ )>

Model (CEP 1.2.0)
<!ELEMENT ce:define-description ( ce:para+ )>
<!ATTLIST ce:define-description
  id ID #IMPLIED>

Description

The element ce:define-description is used to capture the description within an entry in a ce:define-list.

Usage

See ce:define-list.

Version history

Prior to DTD 5.0, this element was called dd. The id attribute was added in CEP 1.2.0.
ce:def-list

Declaration

Model (CEPs 1.1.0–1.1.5)

```xml
<!ELEMENT ce:def-list ( ce:label?, ce:section-title?,
     ( ce:def-term, ce:def-description? )+ )>
<!ATTLIST ce:def-list
     id ID #IMPLIED>
```

Model (CEPs 1.1.6, 1.2.0)

```xml
<!ELEMENT ce:def-list ( ce:label?, ce:section-title?,
     ( ce:def-term, ce:def-description? )+ )>
<!ATTLIST ce:def-list
     id ID #IMPLIED
     role CDATA #IMPLIED>
```

Description

The element `ce:def-list` contains a list of terms and definitions.

Usage

The element `ce:def-list`, definition list, is modeled after HTML’s DL. Its purpose is to capture terms and definitions.

A definition list has an optional label (`ce:label`) and an optional title (`ce:section-title`). It has an optional `id` attribute so that it can become the target of cross-references.

The list itself is a sequence of definition terms, `ce:def-term`, and optional definition descriptions, `ce:def-description`, which consist of one or more paragraphs, `ce:para`. The `ce:def-term` may possess an `id` so that it can be referred to, but due to the efforts needed to create these cross-references, this seldom happens in practice.

If used to capture terms and definitions, as in `ce:nomenclature`, the term is always contained in the `ce:def-term` immediately preceding the `ce:def-description`.

Version history

Prior to DTD 5.0, this element was called `dl`. The `role` attribute was added in CEP 1.1.6.

See also

`ce:list, ce:nomenclature`
ce:def-term

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:def-term ( %text.data; )*>
<!ATTLIST ce:def-term
    id ID #IMPLIED>
```

Description

The element `ce:def-term` is used to capture the term defined or explained in an entry of a `ce:def-list`.

Usage

See `ce:def-list`.

Version history

Prior to DTD 5.0, this element was called `dt`.
ce:degrees

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:degrees ( %richstring.data; )*>

Description

Titles before or after an author name are captured using ce:degrees.

Usage

The element ce:degrees is used for academic degrees, titles of nobility or dignity, military or police ranks, etc. It may occur before and/or after the name.

XML

<ce:degrees>Prof. Dr. Ing.</ce:degrees>
<ce:given-name>Wolfgang</ce:given-name>
<ce:surname>Böhme</ce:surname>

XML

<ce:degrees>Sir</ce:degrees>
<ce:given-name>Michael</ce:given-name>
<ce:surname>Attiya</ce:surname>

XML

<ce:degrees>Ph.D. (Oxon), KBE, FRCS</ce:degrees>

XML

<ce:degrees>Captain</ce:degrees>
<ce:given-name>Jean-Luc</ce:given-name>
<ce:surname>Picard</ce:surname>

XML

<ce:given-name>Patricia D.</ce:given-name>
<ce:surname>Smith</ce:surname>
<ce:degrees>(Mrs.)</ce:degrees>

Presentation

Prof. Dr. Ing. Wolfgang Böhme
Sir Michael Attiya, Ph.D. (Oxon), KBE, FRCS
Captain Jean-Luc Picard
Patricia D. Smith (Mrs.)

The element should not be confused with ce:suffix or ce:roles.

Rendering notes

The second ce:degrees generates a comma, unless it begins with a parenthesis.

Version history

Prior to DTD 5.0, this element was called degs.

See also

ce:author, ce:suffix, ce:roles
**ce:display**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT ce:display ( ce:figure | ce:table | ce:textbox |
                      ce:e-component | ce:formula )>
```

**Description**

The element **ce:display** is a container element for displayed figures, tables, textboxes, e-components and formulae.

**Usage**

To indicate that a figure, table, textbox, e-component or formula is “displayed” — which means that it must appear free-standing with white space above and below at the exact position where the element occurs in the document — it should be embedded in a **ce:display** element.

**See also**

**ce:e-component, ce:figure, ce:table, ce:formula, ce:textbox**
ce:displayed-quote

Declaration

Model (CEPs 1.1.0–1.1.6)

```xml
<!ELEMENT ce:displayed-quote ( ce:simple-para+ )>
<!ATTLIST ce:displayed-quote
  id ID #IMPLIED
  role CDATA #IMPLIED>
```

Model (CEP 1.2.0)

```xml
<!ELEMENT ce:displayed-quote ( ce:simple-para+, ce:source? )>
<!ATTLIST ce:displayed-quote
  id ID #IMPLIED
  role CDATA #IMPLIED>
```

Description

The element `ce:displayed-quote` is used to capture displayed quotes.

Usage

Displayed quotes are pieces of text, mostly but not necessarily quotations, often presented with a certain indent and some white space above and below. They contain one or more simple paragraphs, `ce:simple-para`. The optional subelement `ce:source` is used to describe the source of the text.

```xml
<ce:displayed-quote>
  <ce:simple-para>&ldquo;Everything has a version number&rdquo; and &ldquo;Who is in the dark, should switch on the light&rdquo; are CAM mottos.&lt;/ce:simple-para>
</ce:displayed-quote>
```

```xml
<ce:displayed-quote>
  <ce:simple-para>Louis, I think this is the beginning of a beautiful friendship.&lt;/ce:simple-para>
  <ce:source>Rick Blain (Casablanca&lt;ce:italic&gt;Casablanca&lt;/ce:italic&gt;)&lt;/ce:source>
</ce:displayed-quote>
```

The attribute `role` allows one to categorize displayed quotes. For instance, it makes it possible to mark “poetry” displayed quotes, and handle these in different ways than ordinary displayed quotes. Applications should treat displayed quotes with roles unknown to them as ordinary displayed quotes, i.e., unknown roles must be ignored. The role must belong to a list validated by the XML validation tools. The following value for `role` has been defined:

- poetry signals that the `ce:displayed-quote` contains a table which is used for the stanza of a poem, and that the rows should be printed with the normal line distance.

```xml
<ce:displayed-quote>
  <ce:simple-para>&lt;/ce:displayed-quote>
```
Presentation

Just before our love got lost you said
I am as constant as a northern star
And I said, constant in the darkness
Where’s that at?
If you want me I’ll be in the bar

On the back of a cartoon coaster
In the blue tv screen light
I drew a map of Canada
Oh Canada
And your face sketched on it twice

Version history

Prior to DTD 5.0, this element was called qd. Subelement ce:source was added in CEP 1.2.0.

Light reading

ce:displayed-quote may not be used in CONTENTS-ENTRY-ONLY, HEAD-ONLY or HEAD-AND-TAIL files.

    id ID #IMPLIED>

Description

The element ce:dochead contains the document heading or article type of the article.

Usage

A document heading or article type usually appears above the title. There is a wide variety of examples, such as “Short Communication”, “Erratum”, “Fundamental Study”. Such headings are captured using ce:dochead.

XML

```xml
<ce:dochead>
    <ce:textfn>Short Communication</ce:textfn>
</ce:dochead>
```

It is possible to nest a ce:dochead to obtain a second-order document heading. It is not allowed to nest deeper.

Although usually items with the same ce:dochead are grouped in a table of contents under a similar heading, e.g. “Short communications”, this heading must not be inferred from the document headings of the items. The ce:dochead is only used to display a document heading above the title.

Some article types contain a ce:dochead but no ce:title.

Version history

The id attribute was added in CEP 1.2.0.

Light reading

The ce:dochead appears also in HEAD-ONLY and HEAD-AND-TAIL as well as in CONTENTS-ENTRY-ONLY files.

The id attribute was added in CEP 1.2.0.
ce:doctopics

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:doctopics ( ce:doctopic+ )>

Description

The element ce:doctopics is used to associate an item with one or more topic hierarchies.

Usage

The table of contents of a book or journal issue is only one way to list the items it consists of. It is contained in a file structured according to a book's DTD or content-transport schema. For instance, the proceedings of a large conference may be published in the order of the presentations at that conference. Besides this, it may be useful to associate the item with one or more topic hierarchies, in order to group items of the same scientific relevance. These hierarchies provide other ways to gain access to the items of a book or journal issue; in a sense tables of content different from the one that represents the physical publication can be generated from the topic hierarchies.

For instance, a proceedings about document structuring, whose articles appear in the order of the time when the presentations were given, might contain articles about “XML”, “SGML”, etc., and within the first category, articles about “XML schemas”, “Schematron”, “Relax NG”; but the proceedings might have another division depending on whether the article concerns theoretical aspects, practical aspects or actual implementations in software. The following example illustrates this.

XML

<ce:doctopics>
  <ce:doctopic role="languages">
    <ce:text>XML</ce:text>
    <ce:doctopic role="languages">
      <ce:text>XML schemas</ce:text>
    </ce:doctopic>
  </ce:doctopic>
  <ce:doctopic role="theory and practice">
    <ce:text>Parsers</ce:text>
  </ce:doctopic>
</ce:doctopics>

Presentation

This would generate no output for the item itself, but the item, entitled “An editing tool based on schemas” might appear thus in an online rendering of the topic hierarchy, which resembles a common directory structure:
All articles with equal topic hierarchy end up in the same leaf node of the hierarchy.

The optional attribute role can be used to name topic hierarchies.

Keywords and classification codes, captured with ce:keywords are another way to apply structure to a collection of items. Keywords are mostly designed to ease searching, and typically apply to documents that may occur in many different products. For instance, the mathematics subject classification applies to items of many different journals as well as to books and book chapters. The topic hierarchies, however, are meant mostly for creating alternative tables of content depending on criteria of, say, one certain multi-volume book project.

ce:dochead, ce:keywords
ce:document-thread

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT ce:document-thread ( ce:refers-to-document+ )>

Description

The element ce:document-thread contains a sequence of document identifiers related to the item.

Usage

A document thread consists of one or more references to other items, captured with element ce:refers-to-document.

It is used, for instance, to link an erratum to the original document. An online application can then create a link from the erratum to the original document and, perhaps more importantly, a link from the original document to the erratum.

Discussion threads can be quite complex: In a discussion thread of five documents, the documents could refer to the first one (except the first one itself of course) while the fifth document could also refer to the second and fourth document. An online application could then generate all the links as described in this paragraph (12 in total).

XML

```xml
<ce:document-thread>
  <ce:refers-to-document>
    <ce:pii>S0165-0114(04)00081-8</ce:pii>
  </ce:refers-to-document>
  <ce:refers-to-document>
    <ce:pii>S0165-0114(02)00276-2</ce:pii>
    <ce:doi>10.1016/S0165-0114(02)00276-2</ce:doi>
  </ce:refers-to-document>
</ce:document-thread>
```

Version history

This element was introduced in CEP 1.1.0 and replaced ce:article-thread.

Chapter 8 – The Elements of the CEP

**ce:e-address**

**Declaration**

**Model (CEPs 1.1.0–1.1.6)**

```xml
<!ELEMENT ce:e-address ( %text.data; )*>
<!ATTLIST ce:e-address
type %e-address-type; "email">
```

**Model (CEP 1.2.0)**

```xml
<!ELEMENT ce:e-address ( %text.data; )*>
<!ATTLIST ce:e-address
id ID #IMPLIED
type %e-address-type; "email">
```

**Description**

The purpose of the `ce:e-address` element is to capture the electronic address(es) of the authors of the document.

**Usage**

Each author or collaboration can have zero or more electronic addresses which are tagged using `ce:e-address`. The attribute `type` denotes the type of the electronic address. Its two values (collected in `%e-address-type;`) are `email` and `url`. `email`, the default value, is an email address, and `url` is a complete URL, beginning with `http://`.

**XML**

```xml
<ce:e-address>g.thooft@phys.uu.nl</ce:e-address>
<ce:e-address type="url">http://www.phys.uu.nl/~thooft</ce:e-address>
```

Character entities are not allowed in the content of `ce:e-address` with the exception of `&amp;` (used for an ampersand within a URL).

**Version history**

Prior to DTD 5.0, this element was called `ead`. The `id` attribute was added in CEP 1.2.0.

**See also**

<!ELEMENT ce:e-component (ce:label?, ce:caption*, ce:source?,
( %copyright; )?, ce:keywords*,
( ( ce:link, ce:alt-e-component? ) | ce:e-component )+)>
<!ATTLIST ce:e-component
 id ID #IMPLIED
 role CDATA #IMPLIED>

Description

Electronic components are objects such as applets and video and audio sources, spreadsheets, etc., as well as images that do not satisfy the CAP requirements for ce:figure. The element ce:e-component is provided for this purpose.

Usage

The element ce:e-component, short for electronic component, contains objects that exist in electronic form, and need to be presented to the reader of an electronic rendition of the document. The element has an optional subelement ce:alt-e-component which is used instead in media that cannot handle the electronic component, e.g. in print or in a web PDF.
file. Below we call these media “non-electronic media” and it is worth remembering that
that includes the web PDF file.

Electronic components should not be confused with “views”, see Views (p. 179).

**XML structure of an electronic component**

As for other cases where `ce:link` is used, the type of destination can be inferred from the
entity’s declaration. For a `ce:e-component`, NDATA types APPLICATION, AUDIO, VIDEO
and XML can appear — these are exclusively used in `ce:e-component`. The NDATA type
IMAGE can also appear, this is used for “Non-CAP” artwork, i.e., artwork meant for online
display not satisfying the CAP artwork specifications.

The `ce:e-component` can be “floating” or “displayed”. While the distinction “floating”
and “display” may make little difference in most online representations, it does for the
embedded `ce:alt-e-component`.

A displayed e-component is contained in a `ce:display` element. In an electronic render-
dering, the displayed e-component should appear at the position where the `ce:display`
occurs. What this means for each e-component type (e.g., audio) is up to the application.
Non-electronic media display the embedded `ce:alt-e-component` instead, as if it were
a displayed figure, see below.

A floating e-component is contained within `ce:floats`. A `ce:float-anchor` appears in
the text, and acts as an anchor near to which the e-component should appear. Each floating
e-component must have exactly one `ce:float-anchor`. Non-electronic media render the
embedded `ce:alt-e-component` instead, as if it were a floating figure, see below.

The subelement `ce:label` contains the name or label of the electronic component. The
caption (`ce:caption`), consisting of one or more paragraphs (`ce:simple-para`), contains
descriptive text about the e-component. There can be multiple captions for different roles
and/or languages; each caption must have a different role or language.

The optional subelement `ce:source` is used to describe the source of the figure. The optional
`ce:copyright` element can be used if the copyright owner differs from the article’s
copyright owner.

The optional `ce:keywords` subelements are used to capture keywords for the e-component.
They can be different from the keywords of the item. Normally these are not rendered but
are used to improve searching and annotation. The same constraints as for the item key-
words apply (e.g., allowed class values, nesting).

The attribute `role` is used to indicate the role or alternative presentation style of the e-
component.

**Alternative e-component**

An optional `ce:alt-e-component` can be included in the e-component. This contains a
`ce:link` to an object that is suitable for presentation in non-electronic media. For example,
a significant frame (still image) from a video is an example of content of the alternative e-
component.

Each `ce:alt-e-component` should be treated exactly like a `ce:figure`. All rules for
figures apply. If the e-component is floating or displayed, the `ce:alt-e-component` will
behave like a floating or displayed figure, respectively. Its label is the `ce:label` of the
parent e-component, and its caption is the `ce:alt-e-component`’s own caption. If the
caption is absent this means that the alternative e-component has no caption; it does not mean that the parent’s caption should be used.

Quite the opposite situation occurs if ce:alt-e-component is not encountered within a certain e-component in non-electronic media. It is up to the document’s style to decide what to do with the e-component in such a situation; the default is to ignore the e-component altogether, another style might print a list of e-component captions.

Cross-referencing and nesting

The attribute id can be the target of a cross-reference or of a link from a foreign document. The ce:e-component can be, but does not have to be, referred to from within the text.

The element ce:e-component may be nested; this is mainly to be able to furnish each subcomponent with its own caption. The rules are identical to the rules for ce:figure. Within a nested ce:e-component it is not allowed to nest further ce:e-components.

Background

The element ce:e-component behaves much like ce:figure and ce:Textbox. It is important to realize the implication of this. In HTML, the external files might well be referenced directly, i.e. they are accessed via the A element, e.g.

for more detail, see CNN's <A HREF="korea.mpg">report of President Kim Dae-jung’s visit to North-Korea</A>.

In XML files the element ce:inter-ref — the counterpart of HTML’s A element — are not used to access external files belonging to the document. Instead, these files are accessed through the ce:link element embedded in ce:figure, ce:e-component, etc., and cross-references within the document are made using ce:cross-ref.

XML

```xml
<!ENTITY korea SYSTEM "korea" NDATA VIDEO>
<!ENTITY korea-frame SYSTEM "korea-frame" NDATA IMAGE>
...
for more detail, see CNN's <ce:cross-ref refid="ec1">report of President Kim Dae-jung's visit to North-Korea</ce:cross-ref>.
<ce:e-component id="ec1">
 <ce:label>Video 1</ce:label>
 <ce:caption>
  <ce:simple-para>Coverage of South-Korean President Kim Dae-jung’s historic visit to North-Korea and welcome by Dear Leader Kim Jong-il on Pyongyang International Airport.</ce:simple-para>
 </ce:caption>
 <ce:copyright type="other" year="2000">CNN</ce:copyright>
 <ce:link locator="korea"/>
 <ce:alt-e-component>
  <ce:link locator="korea-frame"/>
 </ce:alt-e-component>
</ce:e-component>
```

Version history

Prior to DTD 5.0, the element upi existed. It had a different purpose: the ce:e-component is specifically for electronic components such as audio and video clips and spreadsheets, etc., whereas upi could contain any object that should not appear in print (hence the name,
The `ce:e-component` can appear in print — the `ce:alt-e-component` is shown instead.

In order to create portions of text, which may include figures, tables or electronic components, that should only appear in certain renditions of the document, the `view` attribute of various elements can be used, see Views (p. 179).

In CEP 1.1.0 a list of subelements `ce:link` and `ce:e-component` became possible. As from CEP 1.1.2, the caption has become repeatable for different languages and roles. Parameter entity `%copyright` was introduced as well.

Subelement `ce:source` was introduced in CEP 1.1.3. The attribute `role` was added in CEP 1.1.5. Subelement `ce:keywords` was added in CEP 1.2.0.

**ce:edition**

**Declaration**

**Model (CEPs 1.1.2–1.2.0)**

```xml
<!ELEMENT ce:edition ( %string.data; )*>
```

**Description**

*ce:edition* contains the edition of an item.

**Usage**

The element *ce:edition* is used to capture the text that describes the edition of an item. The text contains no closing punctuation.

```xml
```

**Version history**

This element was introduced in CEP 1.1.2.
ce:editors

Declaration

Model (CEPs 1.1.2–1.1.5)
<!ELEMENT ce:editors ( ce:author-group+ )>

Model (CEPs 1.1.6, 1.2.0)
<!ELEMENT ce:editors ( ce:author-group+ )>
<!ATTLIST ce:editors role CDATA #IMPLIED>

Description

The element ce:editors is a container element that is used for capturing the editors and their affiliations.

Usage

If the need arises to capture the names, degrees, affiliations of editors, the ce:editors container element is used, that consists of one or more ce:author-group elements. Within this container, the editor names and affiliations are captured as if they were authors. The fact that the ce:author-group elements are contained within ce:editors indicates that the persons, institutions or collaborations captured with ce:author or ce:collaboration are editors. In other words, the container element ce:editors gives the instruction “for author, read editor”.

All the rules for ce:author-group apply, including the rules for implicit and explicit couplings with the affiliations.

XML
<ce:editors>
  <ce:author-group>
    <ce:text>Edited by</ce:text>
    <ce:author>
      <ce:given-name>Jerald P.</ce:given-name>
      <ce:surname>Kuhn</ce:surname>
      <ce:degrees>M.D.</ce:degrees>
    </ce:author>
  ...
  </ce:author-group>
</ce:editors>

Version history

This element was introduced in CEP 1.1.2. The role attribute was added in CEP 1.1.6.
ce:enunciation

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:enunciation ( ce:label, ce:section-title?, ce:para+ )>
<!ATTLIST ce:enunciation
    id ID #IMPLIED
    role CDATA #IMPLIED>

Description

The element ce:enunciation is used to capture enunciations. Enunciations is the catch-all phrase given to the category of structure elements that occur frequently in, e.g., mathematical papers: theorems, lemmas, propositions, proofs, corollaries, definitions, remarks, etc. However, enunciations are not restricted to mathematics.

Usage

The element ce:enunciation consists of a mandatory ce:label element, an optional title ce:section-title and one or more paragraphs. The ce:enunciation can be cross-referenced and therefore has an id attribute.

The ce:label contains the full designation of the enunciation, e.g. “Lemma 1.6” or “Remark”. The ce:section-title is used to capture additional information, e.g. “Fermat’s Theorem”.

XML

<ce:enunciation id="enun37">
    <ce:label>Theorem 1.12</ce:label>
    <ce:para id="p1">
        <ce:italic>Let</ce:italic>
        <mml:math altimg="si301.gif">
            <mml:mrow>
                <mml:mi>V</mml:mi>
            </mml:mrow>
        </mml:math>
        <ce:italic>be a set. Then the cardinality
        of the powerset of</ce:italic>
        <mml:math altimg="si302.gif">
            <mml:mrow>
                <mml:mi>V</mml:mi>
            </mml:mrow>
        </mml:math>,
        <mml:math altimg="si303.gif">
            <mml:mrow>
                <mml:mi mathvariant="script">P</mml:mi>V</mml:mi>
            </mml:mrow>
        </mml:math>
    </ce:para>
</ce:enunciation>
is strictly greater than the cardinality of $V$.

**Proof**

Suppose not, and $V \neq \emptyset$ (for $V = \emptyset$ the theorem is clear). Then there is a bijective mapping $f: V \rightarrow P(V)$.

Let $a = f^{-1}(260)$.
The Elements of the CEP

Chapter 8

Presentation

Theorem 1.12. Let \( V \) be a set. Then the cardinality of the powerset of \( V \), \( P(V) \), is strictly greater than the cardinality of \( V \).

Proof. Suppose not, and \( V \neq \emptyset \) (for \( V = \emptyset \) the theorem is clear). Then there is a bijective mapping \( f : V \rightarrow P(V) \). Let \( a = f^{-1}(\{ x \in V \mid x \notin f(x) \}) \). Then \( a \in f(a) \Leftrightarrow a \notin f(a) \). Contradiction. □

Explanation

Note that in this example certain spaces are “generated” by the XML. For instance, the space between “Let” and “\( V \)” is generated by the whitespace characters between \(<mml:italic>\) and \(<mml:math altimg="si301.gif">\). See also the section Whitespace in the XML file (p. 12).

XML

<ce:enunciation id="25">
<ce:label>Theorem 1.25</ce:label>
<ce:section-title>Pythagoras’ Theorem</ce:section-title>
<ce:para><ce:italic>In a right-angled triangle the square of the hypotenuse is equal to the sum of the squares of the other two sides.</ce:italic></ce:para>

Elsevier Documentation for the XML DTD 5 Family 261
Presentation

Theorem 1.25 (Pythagoras’ Theorem). In a right-angled triangle the square of the hypotenuse is equal to the sum of the squares of the other two sides.

Version history

Prior to DTD 5.0, this element was called enun.

Copy edit considerations

It is well-known that certain enunciations, such as theorems and lemmas, are usually rendered in italics while others, such as definitions, are not. The ce:enunciation element has no provision to indicate a type; italics must be indicated explicitly.

Rendering notes

The ce:label element is rendered in the style of the journal — i.e., if the style is to present the ce:label in bold, this should not be explicitly marked up. The ce:section-title, whose standard presentation is italics, generates parentheses. Closing full stops are generated.

Light reading

ce:enunciation may not be used in CONTENTS-ENTRY-ONLY, HEAD-ONLY or HEAD-AND-TAIL files.
ce:exam-answers

Declaration

Model (CEPs 1.1.0–1.2.0)

```

                <entry>9. b</entry>
                <entry>17. a</entry>
                <entry>25. a</entry>
              </row>
              ...
            </tbody></tgroup>
        </ce:table>
        <ce:display>
      </ce:para>
  </ce:exam-answers>
```

Version history

This element is new in DTD 5. The `view` attribute was added in CEP 1.1.0.
ce:exam-questions

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:exam-questions ( ce:section-title?, %parsec; )>
<!ATTLIST ce:exam-questions
    id ID #IMPLIED
    role CDATA #IMPLIED
    view %view; 'all'>
```

Description

**ce:exam-questions** is used to capture the questions for a Continuous Medical Examination or similar.

Usage

**ce:exam-questions** has a similar content model to **ce:section**. Therefore it can accommodate a wide range of forms of examination questions. However, it can neither have a **ce:label** nor subsections.

An example of examination questions is shown in Figs. 8 and 9.

Version history

This element is new in DTD 5. The **view** attribute was added in CEP 1.1.0.
To obtain the 15 Category I CME credits, the entire examination of lessons from Volume 81 of *Fertility and Sterility* must be taken. The answer sheet will be available in the June 2004 issue and will be graded. A 70% passing score must be achieved and documentation will be mailed with the corrected examination to the participant.

**SART and ASRM. 81:1207–20 (Lesson 16)**

**Objective:** To summarize the procedures and outcomes of assisted reproductive technologies (ART) initiated in the United States during 2000

1. For all IVF cycles in the Society for Assisted Reproductive Technology (SART) 2000 registry, what was the approximate percentage of singleton deliveries?
   - a) 60%
   - b) 65%
   - c) 70%
   - d) 75%
   - e) 80%

2. Using deliveries per transfer from the SART 2000 data, what is the approximate reduced likelihood for success in a woman aged >40 compared with a woman <35 years?
   - a) 40%
   - b) 50%
   - c) 60%
   - d) 70%
   - e) 80%

**Virro et al. 81:1289–95 (Lesson 17)**

**Objective:** To determine the relationship between sperm chromatin structure assay parameters (DNA fragmentation index, DFI; high DNA stainability, HDS) and IVF and IVF/intracytoplasmic sperm injection outcomes

1. When fertilization is on day 1 and blastocyst development is on day 5, on which day does embryo genome expression begin?
   - a) day 1
   - b) day 2
   - c) day 3
   - d) day 4
   - e) day 5

---

Figure 8: An example of Continuing Medical Education Questions. Its XML coding can be found in Fig. 9.
To obtain the 15 Category I CME credits, the entire examination of lessons from Volume 81 of *Fertility and Sterility* must be taken. The answer sheet will be available in the June 2004 issue and will be graded. A 70% passing score must be achieved and documentation will be mailed with the corrected examination to the participant.

**SART and ASRM. 81:1207–1220 (Lesson 16)**

**Objective:** To summarize the procedures and outcomes of assisted reproductive technologies (ART) initiated in the United States during 2000.

1. For all IVF cycles in the Society for Assisted Reproductive Technology (SART) 2000 registry, what was the approximate percentage of singleton deliveries?
   - a) 60%
   - b) 65%
   - c) 70%
   - d) 75%
   - e) 80%

2. Using deliveries per transfer from the SART 2000 data, what is the approximate reduced likelihood for success in a woman aged ≥40 compared with a woman <35 years?
   - a) 40%
   - b) 50%
   - c) 60%
   - d) 70%
   - e) 80%

**Virro et al. 81:1289–1295 (Lesson 17)**

**Objective:** To determine the relationship between sperm chromatin structure assay parameters (DNA fragmentation index, DFI; high DNA stainability, HDS) and IVF and ICSI intracytoplasmic sperm injection outcomes.

1. When fertilization is on day 1 and blastocyst development is on day 5, on which day does embryo genome expression begin?
   - a) day 1
   - b) day 2
   - c) day 3
   - d) day 4
   - e) day 5

Figure 9: XML of the examination questions shown in Fig. 8.
ce:exam-reference

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:exam-reference ( ce:inter-ref )>
<!ATTLIST ce:exam-reference
    view %view; 'all'>
```

Description

The element `ce:exam-reference` is used to create a link to an associated examination that is in a separate article.

Usage

Sometimes the examination associated with an article is not published as part of the article but as a separate article. The element `ce:exam-reference` can be used to create a link in the article to the examination.

Only the values pii and doi for the scheme in `xlink:href` are allowed.

```xml
<ce:exam-reference>
    <ce:inter-ref id="interref7" xlink:href="pii:S0004-3702(02)00193-5">See the examination questions in the following article.</ce:inter-ref>
</ce:exam-reference>
```

Version history

This element is new in DTD 5. The `view` attribute was added in CEP 1.1.0.

Rendering notes

The text of `ce:exam-reference`, i.e., the text of the contained `ce:inter-ref` element, is rendered as a separate paragraph.
**ce:figure**

**Declaration**

**Model (CEPs 1.1.0–1.1.1)**

```xml
<!ELEMENT ce:figure (ce:label?, ce:caption?, ce:copyright?,
   (ce:link | ce:figure )+ )>
<!ATTLIST ce:figure
id ID #IMPLIED>
```

**Model (CEP 1.1.2)**

```xml
<!ELEMENT ce:figure (ce:label?, ce:caption*,
   (%copyright;)?, (ce:link | ce:figure )+ )>
<!ATTLIST ce:figure
id ID #IMPLIED>
```

**Model (CEPs 1.1.3–1.1.5)**

```xml
<!ELEMENT ce:figure (ce:label?, ce:caption*, ce:source?,
   (%copyright;)?, (ce:link | ce:figure )+ )>
<!ATTLIST ce:figure
id ID #IMPLIED>
```

**Model (CEP 1.1.6)**

```xml
<!ELEMENT ce:figure (ce:label?, ce:caption*, ce:source?,
   (%copyright;)?, (ce:link | ce:figure )+ )>
<!ATTLIST ce:figure
id ID #IMPLIED
role CDATA #IMPLIED>
```

**Model (CEP 1.2.0)**

```xml
<!ELEMENT ce:figure (ce:label?, ce:caption*, ce:source?,
   (%copyright;)?, ce:keywords*,
   (ce:link | ce:figure )+ )>
<!ATTLIST ce:figure
id ID #IMPLIED
role CDATA #IMPLIED>
```

**Description**

The element `ce:figure` is used to insert a figure in the document.

**Usage**

Most articles contain artwork in one form or another, and the element `ce:figure` is used to insert the figure. The attribute `id` is used when referring to the figure.

```xml
<ce:cross-ref refid="fig4">Fig. 4</ce:cross-ref>
<ce:cross-ref refid="fig4">Fig. 4(a)</ce:cross-ref>
```

**Explanation**

It is common that the text refers to parts of a figure while in fact the whole figure is cross-referenced. Indeed, in most cases the subfigure will be an integral part of the external artwork file.
Three kinds of figure are distinguished: floating and displayed figures, and figures in graphical abstracts. Floating figures are embedded in a `ce:floats` element, displayed figures are embedded in a `ce:display` element, and a figure in a graphical abstract is the (optional) subelement of `ce:abstract` behind `ce:abstract-sec`. The latter play a special role in a graphical abstract (`ce:abstract`): these are floating, and are not referred to. Their placement is governed by the style of the graphical abstract. There can be only one such figure per abstract. Otherwise, no floating figures may occur in an abstract. (Cross-references to figures are, however, allowed, albeit highly discouraged.)

Floating figures are figures which appear near a point in the text where they are mentioned, mostly at the top or the bottom of the page, spanning one or more columns if needed. Floating figures must be referred to from within the document. To indicate where a floating figure should appear, the element `ce:float-anchor` is used, referring to a `ce:figure` within `ce:floats`. Hence, a floating figure has at least one `ce:cross-ref` or `ce:cross-refs` pointing to it, and exactly one `ce:float-anchor`.

XML

```xml
<ce:cross-ref refid="fig4">Fig. 4</ce:cross-ref>
<ce:float-anchor refid="fig4"/>
```

A displayed figure, obtained by embedding the figure in a `ce:display` element, is a figure which is displayed on a line of its own, separated from the surrounding text by white space, on the spot where it appears in the file.

Figures can be nested one level deep, i.e., a figure within a figure cannot contain yet another figure.

The subelement `ce:label` contains the name of the figure, e.g. “Fig. 2”, “Diagram B”, “Scheme 6” or “Plate III”. For floating figures it is mandatory.

The optional subelement `ce:caption` contains descriptive text of the figure in the form of one or more simple paragraphs, `ce:simple-para`. As from CEP 1.1.2, multiple captions for different languages and/or roles are supported. Different captions must have a different role or language.

The optional subelement `ce:source` is used to describe the source of the figure. The optional subelement `ce:copyright` is used if the copyright owner of the figure is different from that of the item.

The optional `ce:keywords` subelements are used to capture keywords for the figure. They can be different from the keywords of the item. Normally these are not rendered but are used to improve searching and annotation. The same constraints as for the item keywords apply (e.g., allowed class values, nesting).

**Figures without subfigures**

In this subsection it is assumed that the `ce:figure` does not contain any `ce:figure` subelements.

One or more `ce:link` elements provide the link with the external artwork file(s). The artwork files are to be displayed in the order of the `ce:link` elements.

XML

```xml
<ce:cross-ref refid="fig6 fig7">Figs. 6 and 7</ce:cross-ref>
<ce:float-anchor refid="fig6"/> <ce:float-anchor refid="fig7"/>
```
Figures with nested figures

Instead of just ce:links, the top-level figure may contain any combination of ce:link and ce:figure. Nested ce:figures are used if the subfigures need their own captions or copyright statement. A nested ce:figure may only contain ce:links, no ce:figures.

The qualification “displayed” or “floating” is irrelevant for a subfigure. The subfigures are displayed within the main figure in the order which they appear.

Nested figures may have an id and may be the target of a ce:cross-ref. However, the effect is undefined: “clicking” on the cross-reference may lead to the whole figure or the nested figure alone. It is recommended only to cross-reference the top-level figure.

XML

```xml
<ce:figure id="fig2">
  <ce:link locator="gr2ab"/>
  <ce:figure>
    <ce:copyright type="other" yr="2000">Copyright</ce:copyright>
    <ce:link locator="gr2c"/>
  </ce:figure>
</ce:figure>
```

270 Elsevier Documentation for the XML DTD 5 Family
External entities

In practice, the external entities used in the `ce:link` element within a figure will be of notation data type IMAGE. Usage of the other notation types is presently undefined.

Version history

Prior to DTD 5.0, this element was called `fig`. As from CEP 1.1.2, multiple captions are supported. Parameter entity `%copyright;` was introduced as well. Subelement `ce:source` was introduced in CEP 1.1.3.

The `role` attribute was added in CEP 1.1.6. Subelement `ce:keywords` was added in CEP 1.2.0.

Copy edit considerations

In some articles, figures called, say, “Fig. 5(a)” and “Fig. 5(b)” exist, which are to be treated as floating or displayed objects in their own right. These figures are called improper subfigures. In such cases, it is inappropriate to use the nested `ce:figure` construction; these figures are independent top-level `ce:figures`.

Light reading

No floating `ce:figure` may be used in CONTENTS-ENTRY-ONLY, HEAD-ONLY or HEAD-AND-TAIL files.

ce:abstract, ce:display, ce:float-anchor, ce:floats, ce:inline-figure, ce:keywords
ce:first-page

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT ce:first-page ( %richstring.data; )*>

Description

The first page of an item called by a hub file is captured using ce:first-page.

Usage

See ce:pages.

Version history

This element was added in CEP 1.1.0.

See also

ce:include-item, ce:last-page
ce:float-anchor

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT ce:float-anchor EMPTY>
<!ATTLIST ce:float-anchor
  refid IDREF #REQUIRED>

Description

The element ce:float-anchor is a marker to indicate that a floating figure, table, textbox or e-component must appear in the vicinity.

Usage

To indicate that a figure, table, textbox or e-component is “floating”, it is embedded within ce:floats, collected at the beginning of the document.

The anchor, in the form of the empty ce:float-anchor element with a refid attribute pointing to the figure, table, textbox or e-component within ce:floats, tells the rendering application that the float should be placed at a suitable place near the anchor. This anchor is often, but not always, placed after the first cross-reference to that object. There must be exactly one anchor for each floating object.

The ce:float-anchor itself generates no presentation, it marks the place near which the floating object must appear. Its refid attribute may not point to any object outside ce:floats.

c:display, ce:e-component, ce:figure, ce:floats, ce:table
Chapter 8 – The Elements of the CEP

ce:floats

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:floats ( ce:figure*, ce:table*, ce:textbox*,
                   ce:e-component* )>

Description

The element ce:floats is a container element for floating figures, tables, textboxes and e-components.

Usage

To indicate that a figure, table, textbox or e-component is “floating”, it should be embedded in a ce:floats element, a container for all floats located at the beginning of the document, as a child of the top element.

The approximate position of the floating object is indicated by a ce:float-anchor element. This anchor is often, but not always, placed near the first cross-reference to that object.

Version history

Prior to DTD 5.0, floats were placed within the in-line text.

ce:display, ce:e-component, ce:figure, ce:float-anchor, ce:table
ce:footnote

Declaration

Model (CEPs 1.1.0–1.1.5)

```xml
<!ELEMENT ce:footnote ( ce:label, ce:note-para+ )>
<!ATTLIST ce:footnote
 id ID #REQUIRED>
```

Model (CEPs 1.1.6, 1.2.0)

```xml
<!ELEMENT ce:footnote ( ce:label, ce:note-para+ )>
<!ATTLIST ce:footnote
 id ID #REQUIRED
 role CDATA #IMPLIED>
```

Description

Footnotes are captured using ce:footnote.

Usage

The element ce:footnote is used for footnotes. Footnotes are objects, which in print appear at the bottom of the page. The ce:footnote element contains the footnote text and additionally it is an “anchor” nearest to which the footnote should appear. The actual reference in the text is made by a ce:cross-ref.

Each footnote must be referred to. It has an attribute id so that it can be referenced. The mandatory subelement ce:label contains the number of the footnote. The footnote text itself consists of one or more note paragraphs, ce:note-para.

```xml
<ce:cross-ref refid="fn1"><ce:sup>1</ce:sup></ce:cross-ref>
<ce:footnote id="fn1">
<ce:label>1</ce:label>
<ce:note-para>In XML files used for online rendering, it is possible ...</ce:note-para>
</ce:footnote>
```

Version history

The role attribute was added in CEP 1.1.6.

See also

ce:article-footnote, ce:table-footnote, ce:cross.refs
ce:formula

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:formula ( ce:label?, ( mml:math | ce:chem | ce:link | ce:formula+ ) )>
<!ATTLIST ce:formula
  id ID #IMPLIED>

Description

A displayed formula is captured using ce:formula.

Usage

The element ce:formula is one of the possible subelements of ce:display. It contains a mathematical formula mml:math, a chemical formula ce:chem, a ce:link to the image of a formula, or nested ce:formula elements. The number of the formula is captured in the optional ce:label element.

A mml:math element in a ce:formula should not have the value block for the display attribute, but rather the default value inline. This is so because it is inline with respect to the containing ce:formula and to the formula number that the element ce:label generates.

XML

<ce:formula id="ch2">
  <ce:label>(2)</ce:label>
</ce:formula>

Presentation

TLC (CH₂Cl₂/MeOH): \( R_f = 0.45 \); IR: 3423 cm⁻¹ (NH). (2)

XML

<ce:formula><ce:label>(7a)</ce:label><mml:math altimg="si56.gif">
  <mml:mi>&alpha;</mml:mi>=\int
  <mml:mfrac>
    <mml:mrow>
      <mml:msup>
        <mml:mi mathvariant="normal">d</mml:mi>
      </mml:msup>
      <mml:mn>3</mml:mn>
    </mml:mrow>
    <mml:mi>k</mml:mi>
  </mml:mfrac>
</mml:math>
</ce:formula>
\[
\alpha = \int \frac{d^3k}{(2\pi)^3} \langle k|k + q \rangle
\]  
(7a)

**Numbers and nesting depth**

A displayed formula (\texttt{ce:formula} element) may contain other displayed formulae, in which case the main (outer) \texttt{ce:formula} may only consist of an optional \texttt{ce:label} element and one or more nested \texttt{ce:formula}s. Displayed formulae contained in a displayed formula may not themselves contain displayed formulae.

Like all referenceable elements, a displayed formula must have a \texttt{ce:label} element and a value for the id attribute if it is referred to. This holds both for top-level and for lower-level \texttt{ce:formula} elements.

The rule is more complicated for a complicated displayed formula, i.e. a displayed formula that contains nested subformulae. If a complicated displayed formula is referred to, it need not have a \texttt{ce:label} element, provided all of its subformulae have a \texttt{ce:label} element.

This is summarized in the following example:

**XML**

\[
\text{XML} \quad <\text{ce:formula id="eq04">}<\text{ce:label}(4)</\text{ce:formula}> \quad \ldots \quad <\text{ce:formula id="eq05">}<\text{ce:formula}><\text{ce:label}(5a)</\text{ce:formula}> \quad \ldots \quad <\text{ce:formula}><\text{ce:label}(5b)</\text{ce:formula}> \quad \ldots \quad <\text{ce:formula}>\]  

\text{Eqs. }<\text{ce:cross-references refid="eq04 eq05">(4) and (5)。</text:cross-references>

The requirements for nested displayed formulae are described by three rules. The first two are:

1. The \texttt{ce:label} element may occur at the nested level.
2. \texttt{ce:label} elements may not occur at both the main level and the nested level.

These rules imply the following error table for nested equations. Here a 0 or 1 means that an id or a \texttt{ce:label} is absent or present.
Table 6: Error table for nested equations

</tr>
<tr>
<td>16</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>Error: Formula with ce:label element in formula with ce:label element</td>
</tr>
</tbody>
</table>

Additionally there is a rule that if the id attribute appears at the main level, it is not possible to mix unnumbered and numbered subequations. For example, in the example above, it is not allowed to leave out one of the ce:label elements (5a) or (5b). To be precise:

3. If there is an id attribute at the main level and a ce:label element at the nested level, then all nested formulae must have a ce:label element.

Version history

Prior to DTD 5.0, displayed formulae were directly captured in the element fd, without top mml:math or ce:chem element.

Rendering notes

A formula element is rendered in the block that is generated by its parent ce:display element. If it has a label, its space is split into two areas. In the formula area, which is the larger (usually left-hand) area, the contained formula is rendered as an inline formula. In the label area, which is the other area, the formula label is rendered.
ce:further-reading

Declaration

Model (CEPs 1.1.0–1.1.5)

```
<!ELEMENT ce:further-reading ( ce:section-title, ce:further-reading-sec+ )>
<!ATTLIST ce:further-reading
  id ID #IMPLIED
  role CDATA #IMPLIED
  view %view; 'all'>
```

Model (CEPs 1.1.6, 1.2.0)

```
<!ELEMENT ce:further-reading ( ce:section-title?, ce:further-reading-sec+ )>
<!ATTLIST ce:further-reading
  id ID #IMPLIED
  role CDATA #IMPLIED
  view %view; 'all'>
```

Description

The element ce:further-reading contains a list of bibliographic references which are meant as further reading material.

Usage

The element ce:further-reading is an optional part of the tail. It contains bibliographic references which are meant for further reading.

A further-reading list has a ce:section-title, which contains the name of the list, e.g. “Further reading”. The list itself contains one or more sections, ce:further-reading-sec. Each ce:further-reading-sec can also have a ce:section-title, which is a second-order heading. All further-reading sections except the first must have a ce:section-title, for the first this is optional.

The further-reading section contains any combination of bibliographic references, ce:bib-reference, and paragraphs, ce:para. Unlike the ce:bib-references within an ordinary bibliography (ce:bibliography), each ce:bib-reference may or may not be referred to by means of ce:cross-ref or ce:cross-refts. In further-reading lists, the references are often interspersed with text; this is why paragraphs can be inserted between the entries. This is different from the sb:comment and ce:note which exist within ce:bib-reference, since those elements belong uniquely to the specific reference.

Version history

The view attribute was added in CEP 1.1.0. Subelement ce:section-title was made optional in CEP 1.1.6.

Light reading

ce:further-reading is part of HEAD-AND-TAIL material.
See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
### ce:further-reading-sec

#### Declaration

**Model (CEPs 1.1.0–1.1.5)**

\[
\text{<!ELEMENT ce:further-reading-sec( ce:section-title?, ( ce:para | ce:bib-reference )+)>}
\]

\[
\text{<!ATTLIST ce:further-reading-sec}
\text{id ID #IMPLIED}
\text{role CDATA #IMPLIED>}
\]

**Model (CEPs 1.1.6, 1.2.0)**

Chapter 8 – The Elements of the CEP

ce:glossary

Declaration

Model (CEPs 1.1.0–1.1.5)

```xml
<!ELEMENT ce:glossary (ce:section-title, ce:intro?,
                       ce:glossary-sec+ )>
<!ATTLIST ce:glossary
             id ID #IMPLIED
             role CDATA #IMPLIED
             view %view; 'all'>
```

Model (CEPs 1.1.6, 1.2.0)

```xml
<!ELEMENT ce:glossary (ce:section-title?, ce:intro?,
                       ce:glossary-sec+ )>
<!ATTLIST ce:glossary
             id ID #IMPLIED
             role CDATA #IMPLIED
             view %view; 'all'>
```

Description

A glossary is a list of terms or symbols, sometimes with a definition, and sometimes with a reference to the occurrence in the text, appearing in the backmatter of an article.

Usage

A glossary consists of one or more ce:glossary-secs, each containing a subsection within the glossary.

The section title, ce:section-title, contains the title of the glossary, e.g. “Glossary”.

The subelement ce:intro, consisting of one or more paragraphs, is an introductory section at the beginning of the glossary.

Often, a glossary is not subdivided into subsections, in which case it contains just one ce:glossary-sec. If there are subsections, each subsequent ce:glossary-sec must have a ce:section-title, whereas this is optional for the first.

A glossary (section) contains one or more entries, described under ce:glossary-entry.

Version history

The view attribute was added in CEP 1.1.0. The optional ce:intro was introduced in CEP 1.1.1. Subelement ce:section-title was made optional in CEP 1.1.6.
ce:glossary-def

Declaration

Model (CEPs 1.1.0–1.1.5)

<!ELEMENT ce:glossary-def ( %text.data; )*>

Model (CEP 1.1.6)

<!ELEMENT ce:glossary-def ( %textref.data; )*>

Model (CEP 1.2.0)

<!ELEMENT ce:glossary-def ( %textref.data; )*>
<!ATTLIST ce:glossary-def id ID #IMPLIED>

Description

Within a glossary entry, ce:glossary-def is used to capture the definition of a glossary item.

Usage

See ce:glossary-entry.

Version history

In CEP 1.1.6 the content model was extended making it possible to use cross-references (ce:cross-ref, ce:cross-refs, ce:intra-ref and ce:intra-refs) in the content. The id attribute was added in CEP 1.2.0.
ce:glossary-entry

Declaration

Model (CEPs 1.1.0–1.1.3)

```xml
<!ELEMENT ce:glossary-entry ( ce:glossary-heading, ce:glossary-def*,
( %cross-ref; )*, ce:glossary-entry* )>
<!ATTLIST ce:glossary-entry

  ce:glossary-def*, ( %glossary-entry-refs; )?,
  ( ce:see-also | ce:glossary-entry | ce:reader-see )* )>
<!ATTLIST ce:glossary-entry
  id ID #IMPLIED
  role CDATA #IMPLIED>
```

Description

The glossary or a glossary section consists of one or more glossary entries. The element `ce:glossary-entry` is provided in order to capture such an entry.

Usage

A `ce:glossary-entry` consists of an optional `ce:indexed-name` with the term under which the entry should appear in a glossary, a mandatory `ce:glossary-heading`, followed by zero or more `ce:glossary-def`, an optional list of `ce:cross-ref` and `ce:intra-ref` (provided the DTD supports this element), and zero or more nested glossary entries.

A glossary entry has an optional `id` attribute, which can be used to make cross-references from expressions in the text to the terms in the glossary.

Glossary heading and definition

A glossary heading, `ce:glossary-heading` contains the term.

A glossary entry may or may not have accompanying definitions. An example where it has none is when it contains nested entries. The following has one or two definitions per entry.
Chapter 8 – The Elements of the CEP

XML

```
<ce:glossary-entry id="gle001">
  <ce:glossary-heading><ce:italic>a</ce:italic></ce:glossary-heading>
  <ce:glossary-def id="gld001">acceleration (m/s<sup>2</sup>)</ce:glossary-def>
</ce:glossary-entry>

<ce:glossary-entry id="gle002">
  <ce:glossary-heading><ce:italic>e</ce:italic></ce:glossary-heading>
  <ce:glossary-def id="gld002">charge of an electron (1.6022·10<sup>-19</sup> C), base of natural logarithm (2.718281828)</ce:glossary-def>
</ce:glossary-entry>

<ce:glossary-entry id="gle003">
  <ce:glossary-heading><ce:italic>F</ce:italic></ce:glossary-heading>
  <ce:glossary-def id="gld004">force (N)</ce:glossary-def>
</ce:glossary-entry>
```

**Presentation**

- acceleration (m/s<sup>2</sup>)
- charge of an electron (1.6022·10<sup>-19</sup> C),
- base of natural logarithm (2.718281828)
- force (N)

**Cross-references**

If there are page numbers or section numbers referring to the place in the text where the term is used, they can be tagged using the `ce:cross-ref` and `ce:intra-ref` subelements, see the first example above. Depending on the value of `%cross-ref`; the `ce:intra-ref` may or may not be present; this depends on which DTD the glossary is structured with.

Of course, reference to page numbers is not appropriate in electronic media. Therefore, the `ce:cross-ref` and `ce:intra-ref` may also be empty here, meaning that the rendering application must provide another way to establish a “clickable” link, e.g. by turning the whole entry into a hyperlink or by providing a button.

**Nested glossary entries**

Glossary entries can be nested. Two sublevels are allowed.

XML

```
<ce:glossary-entry id="gle045">
  <ce:glossary-heading>biographyid</ce:glossary-heading>
  <ce:monospace>biographyid</ce:monospace>, attribute of

\item year, attribute of date-accepted, year of acceptance
\item year, attribute of copyright, copyright year
\end{itemize}

\textbf{Version history}

Parameter entity \texttt{%glossary-entry-refs}; and element \texttt{ce:indexed-name} were introduced in CEP 1.1.4. In CEP 1.1.6 element \texttt{ce:see} and \texttt{ce:inter-ref} were added to parameter entity \texttt{%glossary-entry-refs};.
ce:glossary-heading

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:glossary-heading ( %textref.data; )*>

Description

Within a glossary entry, ce:glossary-heading is used to capture the item that is defined.

Usage

See ce:glossary-entry.
ce:glossary-sec

Declaration

Model (CEPs 1.1.0–1.1.5)
<!ELEMENT ce:glossary-sec ( ce:section-title?, ce:intro?,
 ce:glossary-entry+ )>
<!ATTLIST ce:glossary-sec
 id ID #IMPLIED
 role CDATA #IMPLIED>

Model (CEPs 1.1.6, 1.2.0)
<!ELEMENT ce:glossary-sec ( ce:section-title?, ce:intro?,
 ce:glossary-entry+ )>
<!ATTLIST ce:glossary-sec
 id ID #IMPLIED
 role CDATA #IMPLIED
 view %view; 'all'>

Description

The element ce:glossary-sec is a section within the glossary.

Usage

See ce:glossary.

Version history

The view attribute was added in CEP 1.1.6.
ce:glyph

Declaration

Model (CEPs 1.1.0–1.2.0)

```
<!ELEMENT ce:glyph EMPTY>
<!ATTLIST ce:glyph
  name %glyph-names; #REQUIRED>
```

Description

Symbols for which no Unicode code point exists, may be captured in a `ce:glyph` element.

Usage

The Elsevier Grid contains a small number of symbols for which no Unicode code point exists. This concerns especially symbols for chemistry and linguistics. Such symbols can be captured using the `ce:glyph` element. It has a required `name` attribute, which contains the name of the glyph. Its value must be one of a list of names enumerated in the DTD. See the section on glyphs (p. 27) for an overview.

It is expected that newer versions of Unicode will incorporate some or all of the glyphs defined by `ce:glyph`. Unicode characters are always preferred over `ce:glyph`s.

```
XML

Bi(NO<sub>3</sub>)<ce:glyph name="rad"/>5H<sub>2</sub>O

XML

C<ce:glyph name="dbnd"/>N bond
```

Version history

Prior to DTD 5.0, all non-ascii symbols were entered as character entities.

Rendering notes

A glyph element is rendered with the glyph of that name that is shown in the Elsevier Grid, or with a similar glyph in a different font/style.
ce:grant-number

Declaration

Model (CEPs 1.1.5, 1.1.6)

```xml
<!ELEMENT ce:grant-number ( %text.data; )*>
<!ATTLIST ce:grant-number
  refid IDREF #REQUIRED>
```

Model (CEP 1.2.0)

```xml
<!ELEMENT ce:grant-number ( %text.data; )*>
<!ATTLIST ce:grant-number
  id ID #IMPLIED
  refid IDREF #REQUIRED>
```

Description

The element `ce:grant-number` contains the identification of a grant under which the document was written.

Usage

The element `ce:grant-number` is linked to a `ce:grant-sponsor` through its mandatory `refid` attribute.

```xml
<ce:grant-number refid="grant4">EF-2008.001</ce:grant-number>
```

For more information, see `ce:grant-sponsor`.

Version history

`ce:grant-number` was added in CEP 1.1.5. The `id` attribute was added in CEP 1.2.0.

See also

`ce:grant-sponsor`
ce:grant-sponsor

Declaration

Model (CEPs 1.1.5–1.2.0)

```xml
<!ELEMENT ce:grant-sponsor ( %text.data; )*>
<!ATTLIST ce:grant-sponsor
  id ID #IMPLIED
  role CDATA #IMPLIED
  xlink:type ( simple ) #FIXED "simple"
  xlink:role CDATA #FIXED "http://www.elsevier.com/xml/linking-roles/grant-sponsor"
  xlink:href CDATA #IMPLIED
  sponsor-id CDATA #IMPLIED>
```

Description

The element `ce:grant-sponsor` contains the name of an organisation that supported the authors.

Usage

Funding received by the authors of scientific works is acknowledged in the acknowledgement section, in footnotes or elsewhere in the document. The elements `ce:grant-number` and `ce:grant-sponsor`, modeled after elements in the NLM Publishing DTD, allow tagging the grant information.

The content of the element `ce:grant-sponsor` is an organisation that supported the authors. The optional attribute `xlink:href` contains a URI that belongs to the funding body or the grant scheme of the funding body. The `id` attribute is the target of one or more `ce:grant-number` elements containing the identifications of the grants that were awarded by the authors. The attribute `sponsor-id` can be used to uniquely identify the sponsor.

```xml
<ce:acknowledgment><ce:simple-para id="sp414">This work was supported by the <ce:grant-sponsor xlink:href="http://www.pharmafoundation.org/" id="GS1">Pharmaceutical Research and Manufacturers of America Foundation</ce:grant-sponsor>, the <ce:grant-sponsor xlink:href="http://www.energy.gov" id="GS2">United States Department of Energy</ce:grant-sponsor> Office of Science (BER) grant number <ce:grant-number refid="GS2">DE-FG02-04ER63803</ce:grant-number>, the <ce:grant-sponsor xlink:href="http://www.nih.gov" id="GS3">National Institutes of Health</ce:grant-sponsor>, <ce:grant-sponsor xlink:href="http://www.nsf.gov" id="GS4">National Science Foundation</ce:grant-sponsor> FIBR Award <ce:grant-number refid="GS4">EF-0425719</ce:grant-number>, the <ce:grant-sponsor xlink:href="http://www.nhlbi.nih.gov/meetings/proteomics.htm" id="GS5">National Heart, Lung, and Blood Proteomics Initiative</ce:grant-sponsor> (<ce:grant-number refid="GS5">HHSN268200248178C</ce:grant-number>), the Whitaker Foundation, and Cellicon Biotechnologies, Inc.</ce:simple-para></ce:acknowledgment>
```
Version history

`ce:grant-sponsor` was added in CEP 1.1.5.

ce:hsp

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:hsp EMPTY>
<!ATTLIST ce:hsp
    sp NMTOKEN "1.0">

Description

The element ce:hsp is used to create explicit horizontal space.

Usage

The element ce:hsp should be used as little as possible. Should the need arise to indicate explicitly the insertion of spaces, ce:hsp can be used. The element has one attribute, sp, which denotes the width of the space measured in "em"s of the current font. The default value if sp is omitted is 1.0.

XML

... concludes the proof.<ce:hsp sp="1.0"/>&squ;

Presentation

... concludes the proof. □

The value of sp is a positive floating number. It is not possible to use ce:hsp for kerning or creating compound symbols.

ce:imprint

Declaration

Model (CEPs 1.1.1–1.2.0)
<!ELEMENT ce:imprint ( %richstring.data; )*>

Description

The imprint of e.g. a book project can be captured with element ce:imprint.

Usage

The element ce:imprint is used in the identification portions of books DTDs and identifies the imprint under which the book project is published.

XML
<ce:imprint>Academic Press</ce:imprint>
<ce:imprint>Churchill Livingstone</ce:imprint>

Version history

This element was added in CEP 1.1.1.
Declaration

Model (CEPs 1.1.0, 1.1.0.1)

```xml
<!ELEMENT ce:include-item ( ce:pii, ce:doi?, %titles;, ce:pages*) >
<!ATTLIST ce:include-item
role CDATA #IMPLIED
view %view; 'all'>
```

Model (CEPs 1.1.1–1.2.0)

```xml
<!ELEMENT ce:include-item ( ce:pii, ce:doi?, ( %titles; )?, ce:pages* )>
<!ATTLIST ce:include-item
role CDATA #IMPLIED
view %view; 'all'>
```

Description

The element `ce:include-item` is used to call documents (articles, chapters, appendices, etc.) into the central hub XML file for books or journal issues.

Usage

The `ce:include-item` element is used to call lower-level files such as chapters into the central hub XML file for books or journal issues.

The subelements `ce:pii` and `ce:doi` are used to identify the called document. Its attribute `role` can be used to inform the application about the type of document to expect, e.g. a chapter, and index or a glossary. Currently only the role add-on is defined.

The `ce:include-item` element also contains a title (`ce:title`) and possibly a subtitle (`ce:subtitle`), and it may contain a sequence of titles (`ce:alt-title`) and subtitles (`ce:alt-subtitle`) in an alternative language. The page range or page ranges of the included item can be given in `ce:pages`. These elements are present to aid in identifying the referred documents, but more importantly, to enable rendering a table of contents using the hub XML file.

In journal issue files the titles are *not* used. In case a hub file does contain titles, the title elements can be used to display a different title, e.g. an abbreviated one.

```xml
<ce:include-item>
  <ce:pii>B0-12-227085-1/00001-1</ce:pii>
  <ce:title>Core Issues in Primary Care</ce:title>
</ce:include-item>

<ce:include-item>
  <ce:pii>B0-12-227085-1/00002-3</ce:pii>
  <ce:title>Subject index</ce:title>
</ce:include-item>
```

Elsevier Documentation for the XML DTD 5 Family 297
The attribute role allows one to categorize the included items. For instance, it makes it possible to mark “add-on” items, and handle these in different ways than ordinary items.
Applications should treat `<ce:include-items>` with roles unknown to them as ordinary items, i.e., unknown roles must be ignored. The role must belong to a list validated by the XML validation tools. The following values for `<role>` have been defined:

- **add-on** is used in the issue hub to indicate that the item is an add-on item. The main item does not use this attribute. Included items that belong to a section of abstracts, or news items, etc., do not possess this attribute.
- **index**, **glossary**, and **bibliography** are used in an MRW hub to indicate that the item is an index, glossary or bibliography, respectively.

**Version history**

This element was introduced in CEP 1.1.0. In CEP 1.1.1 the titles were made optional.
**ce:index**

**Declaration**

**Model (CEPs 1.1.0–1.1.5)**

```xml
<!ELEMENT ce:index ( ce:section-title, ce:intro?, ce:index-sec+ )>
<!ATTLIST ce:index id ID #IMPLIED
role CDATA #IMPLIED
view %view; 'all'>
```

**Model (CEPs 1.1.6, 1.2.0)**

```xml
<!ELEMENT ce:index ( ce:section-title?, ce:intro?,
ce:index-sec+ )>
<!ATTLIST ce:index id ID #IMPLIED
role CDATA #IMPLIED
view %view; 'all'>
```

**Description**

An index is a list of terms (index entries) and references to places in the text that are relevant to each term.

**Usage**

An index is a list of terms (index entries) and references to places in the text that are relevant to each term. The index entries are divided in sections. It is possible to nest terms.

The subelement `ce:intro`, consisting of one or more paragraphs, is an introductory section at the beginning of the index.

If there is more than one `ce:index-sec`, then each must have a `ce:section-title`, except for the first which is optional.

Different types of indexes are possible, e.g. subject index, name index, and formula index. An entry in a subject index is a concept described in the work for which the subject index is compiled; an entry in a name index is the name of a person referred to in the text of the work; an entry in a formula index is a (chemical) formula occurring in the text of the work. The type of index can be indicated by the attribute `role`.

Index sections are lists of index entries, `ce:index-entry`. Each index entry starts with text describing the index entry, the index heading (`ce:index-heading`). This can be followed by a “see” reference or a number of cross-references. These can be followed by “see also” references and nested index entries in an arbitrary order.

Cross-references within the index can occur and are of two types: “see” (`ce:see`) and “see also” (`ce:see-also`). A “see” reference points to a term that is preferred over the present one. A “see also” reference points to a term that is related to the present one.

Most index entries point to one or more places in the text that is relevant to that index entry. This is achieved through the `ce:cross-ref` or `ce:intra-ref` element. The latter
is to be used for referencing to documents that are part of a collection, for instance a major reference work.

The following example is based on a major reference work:

XML

```xml
<ce:index id="ix01">
  <ce:section-title id="st38">Subject Index</ce:section-title>
  ...
  <ce:index-sec id="ids5">
    <ce:index-entry id="idx33">
      <ce:index-heading>continuing professional education (CPE)</ce:index-heading>

\text{<!ATTLIST ce:index-entry id ID #IMPLIED role CDATA #IMPLIED>}
\]

Model (CEPs 1.1.6, 1.2.0)

\[
\text{<!ELEMENT ce:index-entry ( ce:indexed-name?, ce:index-heading, ( %index-entry-refs; )?, ( ce:see-also | ce:index-entry | ce:reader-see )* )>}
\]

\[
\text{<!ATTLIST ce:index-entry id ID #IMPLIED role CDATA #IMPLIED>}
\]

Description

Every index entry is captured using \text{ce:index-entry}.

Usage

The element \text{ce:index-entry} consists of an optional \text{ce:indexed-name} with the term under which the entry should appear in an index, a \text{ce:index-heading}, which is optionally followed by a “see” reference to another index entry (\text{ce:see}) or a number of cross-references, optionally followed by a mixture of “see-also” references to other index entries (\text{ce:see-also}), sub-index entries and general references (\text{ce:reader-see}).

The cross-references can be either a \text{ce:cross-ref} or a \text{ce:intra-ref}. The latter is to be used for referencing to documents that are part of a set, for instance a major reference work. For some examples, see \text{ce:see} and \text{ce:see-also}.
Version history

Parameter entity `%see`; and element `ce:reader-see` were introduced in CEP 1.1.3. Parameter entity `%index-entry-refs`; and element `ce:indexed-name` were introduced in CEP 1.1.4. In CEP 1.1.6 multiple `ce:see` elements were made possible in parameter entity `%index-entry-refs`;.

See also

`ce:index, ce:see, ce:see-also, ce:reader-see`
ce:index-flag

Declaration
Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:index-flag ( ce:index-flag-term, ce:index-flag-see?, ( ce:index-flag-see-also | ce:index-flag )* )>
<!ATTLIST ce:index-flag
  id ID #REQUIRED
  role CDATA #IMPLIED>
```

Description
The element `ce:index-flag` is envisioned for possible utilization by book indexers to use to aid in the to-be-developed process used to generate back-of-book indices.

Usage
The element `ce:index-flag` allows a term to be marked for inclusion in an index. Its content model is closely related to that of `ce:index-entry`, and it is possible to generate an index entry from the flagged index term.

Content for element `ce:index-flag` consists of a required element `ce:index-flag-term`, followed by optional/repeatable `ce:index-flag-see` and/or `ce:index-flag-see-also` and/or nested `ce:index-flag` elements.

The element `ce:index-flag` has one required attribute, id.

```xml
<ce:para id="p24">One of the enemies of the ant is the aardvark<ce:index-flag id="a1234">
  <ce:index-flag-term>aardvark</ce:index-flag-term>
  <ce:index-flag-see-also>anteater</ce:index-flag-see-also>
</ce:index-flag> ...
</ce:para>
```

Secondary index terms are markup up as nested `ce:index-flag` elements.

```xml
<ce:caption id="c054">
  <ce:simple-para id="sp055">Oberkörperhochlagerung bei Herzinsuffizienz<ce:index-flag id="idx0040">
    <ce:index-flag-term>Lagerung</ce:index-flag-term>
    <ce:index-flag id="idx0041">
      <ce:index-flag-term>bei Herzinsuffizienz</ce:index-flag-term>
    </ce:index-flag>
  </ce:index-flag> [A400]<ce:caption>
</ce:caption>
```

Because the element `ce:index-flag` has an ID, it can (and should) be the target of a `ce:intra-ref` element in the Index. This gives the possibility that in a hyperlinked PDF or HTML file, the reader can click on the entry terms in the Index and reach the exact location in the text. Without `ce:index-flag` elements the targets are at paragraph level.
XML

This element was introduced in CEP 1.1.0.

Rendering notes

This element should not be rendered in either electronic or hardcopy versions of the book.

Web platforms may use the ce:index-flag element to generate additional, hyperlinked, indexes, for example, per chapter, or for a selected set of chapters or volumes.
ce:index-flag-see

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT ce:index-flag-see ( %text.data; )*>

Description

The element ce:index-flag-see is used to delimit a term to be indexed, within the
content model of the ce:index-flag element.

Usage

Within ce:index-flag, the element ce:index-flag-see is used to create a “see” entry.
This corresponds to a ce:see within an index entry.

XML
<ce:para id="560">text text ...
   <index-flag id="a1234">
      <index-flag-term>acquired immune
deficiency syndrome</index-flag-term>
      <index-flag-see>AIDS</index-flag-see>
   </index-flag> ... end of paragraph.
<ce:para>

Version history

This element was introduced in CEP 1.1.0.

See also

ce:index-flag
ce:index-flag-see-also

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT ce:index-flag-see-also( %text.data; )*>  

Description

The element ce:index-flag-see-also is used to delimit a term to be indexed, within the content model of the index-flag element.

Usage

In order to flag a term for a “see also” index entry, the element ce:index-flag-see-also is used. It corresponds to a ce:see-also within an index entry.

See ce:index-flag for a usage example.

Version history

This element was introduced in CEP 1.1.0.
**ce:index-flag-term**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT ce:index-flag-term ( %text.data; )*>
```

**Description**

The element `ce:index-flag-term` is used to delimit a term to be indexed, within the content model of the `ce:index-flag` element.

**Usage**

The `ce:index-flag-term` contains the term to be indexed within a `ce:index-flag` element. It corresponds with the `ce:index-heading` within a `ce:index-entry`.

Content for index-flag-term consists of the text.data parameter entity from the Common Element Pool (CEP). See `ce:index-flag` for a usage example.

**Version history**

This element was introduced in CEP 1.1.0.
ce:index-heading

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:index-heading ( %textref.data; )*>

Description

The heading of an index entry is captured using ce:index-heading.

Usage

Each index entry starts with a descriptive text, the heading.

For some examples, see ce:see and ce:see-also.

See also

ce:index, ce:index-entry, ce:see, ce:see-also
ce:index-sec

Declaration

Model (CEPs 1.1.0–1.1.5)

```
<!ELEMENT ce:index-sec ( ce:section-title?, ce:intro?,
                       ce:index-entry+ )>
<!ATTLIST ce:index-sec
     id   ID          #IMPLIED
     role CDATA      #IMPLIED>
```

Model (CEPs 1.1.6, 1.2.0)

```
<!ELEMENT ce:index-sec ( ce:section-title?, ce:intro?,
                       ce:index-entry+ )>
<!ATTLIST ce:index-sec
     id   ID          #IMPLIED
     role CDATA      #IMPLIED
     view %view;      'all'>
```

Description

The element `ce:index-sec` is a section within the index.

Usage

See `ce:index`.

Version history

The `view` attribute was added in CEP 1.1.6.
ce:inf

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:inf ( %richstring.data; )*>
<!ATTLIST ce:inf
  loc %loc; "post">
```

Description

Subscripts are captured using `ce:inf`.

Usage

Subscripts (inferior text) are captured using `ce:inf`.

The optional attribute `loc` can have the values `pre` and `post`, the latter is equivalent to omitting the attribute altogether. If `loc` is equal to `pre` this is to signify that the element belongs to the subsequent object.

**XML**

```xml
<ce:sup loc="pre">238</ce:sup><ce:inf loc="pre">92</ce:inf>U
```

**Presentation**

$$^{238}_{92}U$$

By default, a super- and subscript appearing at one object will be displayed stacked, i.e. above each other. Staggered super- and subscripts (for example, $R^i_{jk}$) can only be used in math mode.

See also

`ce:sup`
ce:initials

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT ce:initials ( %string.data; )*>

Description

In order to assist applications that need to determine the correct initials based on the given name, the element ce:initials has been provided. It is only used if the initials cannot be inferred from the given name by taking the first letters, preserving dashes.

The element is used by applications that want initials in running heads or in tables of content rather than the full given name.

Note that ce:initials does not replace ce:given-name if the author only supplied initials.

XML
<ce:author>
  <ce:initials>J.W.Th.</ce:initials>
  <ce:given-name>Joannes Wilhelmus Theodorus</ce:given-name>
  ...
</ce:author>

Usage

See ce:author.

Version history

Prior to DTD 5.0, the element was called inits.
ce:inline-figure

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:inline-figure ( ce:link )>
<!ATTLIST ce:inline-figure baseline NMTOKEN "0.0">
```

Description

The element `ce:inline-figure` is used to insert an image in the running text, e.g. a symbol that does not occur in the standard character set.

Usage

An in-line figure, also less accurately known as fixed graphic, is a figure that occurs exactly at the point where it occurs in the document instance. It consists of one `ce:link` element, which refers to the external artwork file.

The bounding box of an in-line figure is as tight as possible. The vertical position of the in-line figure is controlled by the attribute `baseline`, whose default value is 0.0. It denotes the fraction of the height that appears below the baseline.

**XML**

```xml
A<ce:inline-figure baseline="0.33">
    <ce:link locator="fx1"/>
</ce:inline-figure>&Omega;
```

**Presentation**

\[ \text{Ω} \]

**Explanation**

Since the value of `baseline` is 0.33, the baseline is at one-third of the in-line figure, represented by the box, i.e., one-third of the graphic is below the baseline.

An inline-figure appears in the running text like a character would do. No spaces or newlines are generated before or after an in-line figure. This makes it different from a displayed figure which appears on a line of its own with vertical space above and below it, see `ce:figure`. The graphic file is shown as is, i.e. it will not adapt to the surrounding font size or style, as would a `ce:glyph`.

In-line figures should not occur too deeply in the parse tree of the document.

Version history

Prior to DTD 5.0, this element was called `inline-fig`.

`ce:figure, ce:glyph`
Chapter 8 – The Elements of the CEP  ce:inter-ref

ce:inter-ref

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:inter-ref ( %text.data; )*>
<!ATTLIST ce:inter-ref
  id ID #IMPLIED
  xlink:type ( simple ) #FIXED "simple"
  xlink:role CDATA #IMPLIED
  xlink:href CDATA #REQUIRED>
```

Description

The `ce:inter-ref` element is used to reference an object “not under control of the publisher”. Examples are HTML pages on the World-Wide Web, records in third-party on-line databases. The `ce:inter-ref` element is a simple link according to the XLink standard.

Usage

The `ce:inter-ref` is a versatile element used to refer to foreign objects. Its content is popularly seen as “text to click on”, but it may be empty.

The attribute `xlink:href` determines the actual link. Its value is a URI-reference (URI: Universal Resource Identifier) according to RFC2396. The URI-reference consists of three parts:

- the protocol or scheme, which is the part up to the colon; the allowed schemes are documented below;
- the resource identifier, which is the part from the colon to the end or up to the hash sign; in the text below we will refer to it as the locator;
- the fragment identifier, which is the part after the hash sign; it may be an ID in the target document, or a more complicated XPath expression; the fragment identifier is optional.

For rules regarding the encoding of URI-references, see the sections on rendering and copy edit considerations below.

The attribute `xlink:role` is used to indicate what kind of object is to be expected at the other end of the link. Its value is a URI of the form

```
http://www.elsevier.com/xml/linking-roles/<role name>
```

Currently, there are only three role names: “preprint”, “inspec”, and any MIME type.

A number of schemes to be used in `xlink:href` are allowed, see the table below. (See [28] for the latest list of allowed schemes.) For each value of the scheme different rules may apply. These are described below.

**The scheme in xlink:href is equal to aoi**

The locator is an astronomical object identifier (aoi). It consists of the doi of the article, followed by the text `&` or `&#x0026;`, followed by the agreed object name. No roles are to be specified. Note that, if there is a space in the aoi, it is encoded as `%20`.

**XML**

```xml
<ce:inter-ref id="interref1"
xlink:href="aoi:10.1016/j.newast.2003.11.001#%026;CF%20Pup">⌢
▷ CF Pup</ce:inter-ref>
```
Chapter 8 – The Elements of the CEP

The scheme in xlink:href is equal to doi

The locator is a digital object identifier (DOI, see www.doi.org). No roles are to be specified. The path may contain an ID within the target document, in the form of a fragment identifier.

XML

```xml
<ce:inter-ref id="interref2"
    xlink:href="doi:10.1016/S0004-3702(02)00193-5">...</ce:inter-ref>
```

Standards Note: The doi scheme is officially recognized as part of the info URI scheme. In this scheme the above xlink:href would become

```xml
xlink:href="info:doi:10.1016/S0004-3702(02)00193-5"
```

The form according to the info URI scheme is not (yet) allowed in the Common Element Pool.

The scheme in xlink:href is equal to fiz

The locator addresses a document in the FIZ database (www.fiz-karlsruhe.de). The attribute xlink:role is mandatory here; currently the only allowed value is inspec (denoting an inspec record). Note that the colon in the FIZ code is encoded as %3A.

XML

```xml
<ce:inter-ref id="interref3"
    xlink:role="http://www.elsevier.com/xml/linking-roles/inspec"
    xlink:href="fiz:85%3A2535122">...</ce:inter-ref>
```

Standards Note: The fiz scheme is officially recognized as part of the info URI scheme. In this scheme the above xlink:href would become

```xml
xlink:href="info:fiz:10.1016/S0004-3702(02)00193-5"
```

The form according to the info URI scheme is not (yet) allowed in the Common Element Pool.

The scheme in xlink:href is equal to genbank

The locator is a Genbank accession number, assigned by the NIH genetic sequence database (an annotated collection of all publicly available DNA sequences, www.ncbi.nlm.nih.gov). No roles are to be specified. This scheme is deprecated and was replaced by the scheme “ncbi-n”.

XML

```xml
<ce:inter-ref id="interref4"
    xlink:href="genbank:AB026824">...</ce:inter-ref>
```

Standards Note: The genbank scheme is officially recognized as part of the info URI scheme under the name ddbj-embl-genbank. In this scheme the above xlink:href would become

```xml
xlink:href="info:ddbj-embl-genbank:AB026824"
```

The form according to the info URI scheme is not (yet) allowed in the Common Element Pool.

Standards Note: The Genbank accession numbers are accommodated by the Life Sciences IDentifier (LSID), a proposed standard of the OMG. In this scheme the above xlink:href would become something like

```xml
```

The form according to the LSID URI scheme is not (yet) allowed in the Common Element Pool.

The scheme in xlink:href is equal to embl

The locator is an EMBL accession number, assigned by the EMBL nucleotide sequence database, www.ebi.ac.uk/embl. No roles are to be specified.
The embl scheme is a synonym for the genbank scheme. Only the assigning authority is different.

The scheme in xlink:href is equal to http, https, ftp, ftps, or mailto

The locator is a URL. Optionally a role can be specified: it must then be a MIME type. The path may contain a named location within the target document (this is the part which comes after the # in the HREF attribute of HTML’s A element), in the form of a fragment identifier. http, https, ftp, ftps, and mailto are officially recognized URI schemes.

The scheme in xlink:href is equal to arxiv

The locator is an address of the arXiv.org e-Print archive (www.arxiv.org). The attribute xlink:role is mandatory here; currently the only allowed value is preprint.

The scheme in xlink:href is equal to sid

The locator holds the non-formatted PII of the article itself, a slash and the so-called anchor text corresponding to the enclosed structure reference. No roles are to be specified.

This scheme is used for Dymond linking (i.e. external object linking for chemical structures).

The scheme in xlink:href is equal to ctgov

The locator is an NCT number, the National Library of Medicine’s unique identifier for a record at ClinicalTrials.gov. No roles are to be specified.

The scheme in xlink:href is equal to omim

The locator is an OMIM number which identifies a record in Online Mendelian Inheritance in Man, a database containing a catalog of human genes and genetic disorders. No roles are to be specified.
XML

MIM <ce:inter-ref id="interref11"
xlink:href="omim:601240">601240</ce:inter-ref>

Note that only the number is linked.

The scheme in xlink:href is equal to mint

The locator is a MINT number which identifies a record in the Molecular INTeraction database. No roles are to be specified. Example:

XML

MINT-<ce:inter-ref id="interref12"
xlink:href="mint:6166710">6166710</ce:inter-ref>

Note that only the number is linked.

The HTTP URL is constructed from the MINT URI by prepending the MINT number with: http://mint.bio.uniroma2.it/mint/search/interaction.do?interactionAc=MINT-. The resulting link of the above example is:

Presentation

MINT-6166710

Note: This protocol is used in the FEBS structured summaries. There the string 'MINT-' is included in the content of the ce:inter-ref element.

The scheme in xlink:href is equal to uniprotkb

The locator is a Uniprot number which identifies a record in UniProtKB, the Universal Protein Resource Knowledgebase. No roles are to be specified. Example:

XML

uniprotkb:<ce:inter-ref id="interref13"
xlink:href="uniprotkb:Q9H0H5">Q9H0H5</ce:inter-ref>

Note that only the number is linked.

The HTTP URL is constructed from the UniProtKB URI by prepending the UniProtKB number with: http://www.uniprot.org/uniprot/. The resulting link of the above example is:

Presentation

uniprotkb:Q9H0H5

Note: This protocol is used in the FEBS structured summaries. There the content of the ce:inter-ref element is the name of the protein.

The scheme in xlink:href is equal to mi

The locator is an MI number which identifies a record in the EMBL-EBI IntAct database for Molecular Interactions. No roles are to be specified. Example:

XML

MI:<ce:inter-ref id="interref14"
xlink:href="mi:0218">0218</ce:inter-ref>

Note that only the number is linked.
The HTTP URL is constructed from the MI URI by prepending the MI number with:
http://www.ebi.ac.uk/ontology-lookup/?termId=MI:. The resulting link of the above example is:

Presentation
MI:0218

Note: This protocol is used in the FEBS structured summaries. There the content of the `ce:inter-ref` element is the name of the interaction.

**The scheme in `xlink:href` is equal to `pdb`**

The locator is a Worldwide Protein Data Bank accession number which identifies a record in the Worldwide Protein Data Bank. Example:

XML
```xml
<ce:inter-ref id="interref15" xlink:href="pdb:2pmz">2pmz</ce:inter-ref>
```

The HTTP URL for viewing the molecule in the FirstGlance tool is constructed from the pdb URI by prepending the pdb accession number with:
http://firstglance.jmol.org/fg.htm?mol=. The resulting link of the above example is:

Presentation
2pmz

**The scheme in `xlink:href` is equal to `pmid`**

The locator is a Pubmed ID which identifies an abstract at Pubmed. No roles are to be specified. Example:

XML
```xml
<ce:inter-ref id="interref16" xlink:href="pmid:19011746">19011746</ce:inter-ref>
```

Note that only the number is linked.

The HTTP URL for PMIDs is constructed from the PMID URI by prepending the PMID with:
http://www.ncbi.nlm.nih.gov/pubmed/. The resulting link of the above example is:

Presentation
PMID: 19011746

**The scheme in `xlink:href` is equal to `ncbi-n`**

The locator is an NCBI nucleotide accession number, assigned by the NIH genetic sequence database (an annotated collection of all publicly available DNA sequences, www.ncbi.nlm.nih.gov). No roles are to be specified.

XML
```xml
<ce:inter-ref id="interref4" xlink:href="ncbi-n:AB026824">...</ce:inter-ref>
```

The HTTP URL for an NCBI nucleotide accession number is constructed by prepending the accession number with:
&db=nucleotide&doptcmdl=genbank&term=. The resulting link of the above example is:

Presentation
AB026824

The scheme in xlink:href is equal to ncbi-p

The locator is a NCBI protein accession number, assigned by the NIH genetic sequence database (an annotated collection of all publicly available DNA sequences, www.ncbi.nlm.nih.gov). No roles are to be specified.

XML
<ce:inter-ref id="interref4"
xlink:href="ncbi-p:Q9JJS7">...</ce:inter-ref>

The HTTP URL for an NCBI protein accession number is constructed by prepending the accession number with:
&db=protein&doptcmdl=genbank&term=. The resulting link of the above example is:

Presentation
Q9JJS7

The scheme in xlink:href is equal to ncbi-wgs

The locator is an NCBI WGS accession number, assigned by the NIH genetic sequence database (an annotated collection of all publicly available DNA sequences, www.ncbi.nlm.nih.gov). No roles are to be specified.

XML
<ce:inter-ref id="interref4"
xlink:href="ncbi-wgs:AAAA01000001">...</ce:inter-ref>

The HTTP URL for an NCBI WGS accession number is constructed by prepending the accession number with:
&db=nucleotide&doptcmdl=genbank&term=. The resulting link of the above example is:

Presentation
AAAA01000001

The scheme in xlink:href is equal to ncbi-mmdb

The locator is an NCBI MMDB accession number, assigned by the NIH genetic sequence database (an annotated collection of all publicly available DNA sequences, www.ncbi.nlm.nih.gov). No roles are to be specified.

XML
<ce:inter-ref id="interref4"
xlink:href="ncbi-mmdb:50188">...</ce:inter-ref>

The HTTP URL for an NCBI MMDB accession number is constructed by prepending the accession number with:
&db=structure&doptcmdl=genbank&term=. The resulting link of the above example is:
The scheme in `xlink:href` is equal to `ncbi-mga`

The locator is an NCBI MGA accession number, assigned by the NIH genetic sequence database (an annotated collection of all publicly available DNA sequences, [www.ncbi.nlm.nih.gov](http://www.ncbi.nlm.nih.gov)). No roles are to be specified.

**XML**

```xml
<ce:inter-ref id="interref4"
xlink:href="ncbi-mga:AMAAA0000001">...</ce:inter-ref>
```

The HTTP URL for an NCBI MGA accession number is constructed by prepending the accession number with:

http://www.ncbi.nlm.nih.gov/nuccore/. The resulting link of the above example is:

**Presentation**

AMAAA0000001

The scheme in `xlink:href` is equal to `ncbi-geo`

The locator is an NCBI GEO accession number, assigned by the NIH genetic sequence database (an annotated collection of all publicly available DNA sequences, [www.ncbi.nlm.nih.gov](http://www.ncbi.nlm.nih.gov)). No roles are to be specified.

**XML**

```xml
<ce:inter-ref id="interref4"
xlink:href="ncbi-geo:GSE6364">...</ce:inter-ref>
```

The HTTP URL for an NCBI GEO accession number is constructed by prepending the accession number with:

http://www.ncbi.nlm.nih.gov/geo/query/acc.cgi?acc=. The resulting link of the above example is:

**Presentation**

GSE6364

The scheme in `xlink:href` is equal to `ncbi-tnm`

The locator is an NCBI Taxonomy accession number, assigned by the NIH genetic sequence database (an annotated collection of all publicly available DNA sequences, [www.ncbi.nlm.nih.gov](http://www.ncbi.nlm.nih.gov)). No roles are to be specified.

**XML**

```xml
<ce:inter-ref id="interref4"
xlink:href="ncbi-tnm:7254">...</ce:inter-ref>
```

The HTTP URL for an NCBI Taxonomy accession number is constructed by prepending the accession number with:

http://www.ncbi.nlm.nih.gov/Taxonomy/Browser/wwwtax.cgi?id=. The resulting link of the above example is:

**Presentation**

7254
The scheme in xlink:href is equal to ccdc

The locator is a CCDC number, assigned by the Cambridge Crystallographic Data Centre (http://www.ccdc.cam.ac.uk). No roles are to be specified.

XML

```xml
<ce:inter-ref id="interref4"
xlink:href="ccdc:AI631510">...</ce:inter-ref>
```

The Cambridge Crystallographic Data Centre has not yet created an HTTP URL construct for the CCDC numbers.

The scheme in xlink:href is equal to tair

The locator is an Arabidopsis number (TAIR), assigned by The Arabidopsis Information Resource http://www.arabidopsis.org). No roles are to be specified.

XML

```xml
<ce:inter-ref id="interref4"
xlink:href="tair:AT1G01020">...</ce:inter-ref>
```

The HTTP URL for a TAIR number is constructed by prepending the accession number with:
http://www.arabidopsis.org/servlets/TairObject?type=locus&name=. The resulting link of the above example is:

```
Presentation
AT1G01020
```

The scheme in xlink:href is equal to astm

The locator is an ASTM number, assigned by the American Society for Testing and Materials http://www.astm.org). No roles are to be specified.

XML

```xml
<ce:inter-ref id="interref4"
xlink:href="astm:G63">...</ce:inter-ref>
```

The HTTP URL for an ASTM number is constructed by prepending the accession number with:
http://www.astm.org/Standards/. The resulting link of the above example is:

```
Presentation
G63
```

The scheme in xlink:href is equal to igsn

The locator is an IGSN number, an International Geo Sample Number, assigned by the System for Earth Sample Registration (http://www.geosamples.org/). No roles are to be specified.

XML

```xml
<ce:inter-ref id="interref4"
xlink:href="igsn:HRV0035F0">...</ce:inter-ref>
```

The HTTP URL for an IGSN number is constructed by prepending the accession number with: http://www.geosamples.org/profile?igsn=. The resulting link of the above example is:
The scheme in `xlink:href` is equal to `cran`

The locator is a CRAN ID, assigned by the Comprehensive R Archive Network for binary distributions of the base system and contributed packages [http://cran.r-project.org/](http://cran.r-project.org/). No roles are to be specified.

**XML**

```xml
<ce:inter-ref id="interref4"
  xlink:href="cran:optimx">...</ce:inter-ref>
```

The HTTP URL for a CRAN ID is constructed by prepending the package id with:
http://CRAN.R-project.org/package=. The resulting link of the above example is:

**Presentation**

optimx

The scheme in `xlink:href` is equal to `eslide`

The locator is an ID of high-resolution slides hosted on a server. No roles are to be specified.

**XML**

```xml
<ce:inter-ref id="interref5"
  xlink:href="eslide:51787">eSlide: 51787</ce:inter-ref>
```

Relation with DTD 4

Prior to DTD 5, `inter-ref` had three attributes: `locator-type`, `locator` and `object-type`.

- `locator-type` corresponds to the scheme part of `xlink:href`. The schemes have the same names as the former `locator-type` attribute, except for `xxx-archive`, which now is called `arxiv`, in agreement with the change of name of the preprint service it refers to.
- `locator` corresponds to the path part of `xlink:href`.
- `object-type` corresponds to `xlink:role`. The roles have the same names as the former `object-type` attribute, prepended by the string

**XLink aspects**

`ce:inter-ref` has an attribute `xlink:type` with the fixed value `simple`. This makes it into a simple link according to the XLink standard. The `xlink:href` and `xlink:role` attributes comply with the XLink requirements for a simple link. Thus `ce:inter-ref` can be processed by general XLink software.

**Rendering notes**

If the rendering application cannot deal with `ce:inter-ref`, or the scheme in `xlink:href`, it should not complain and merely output the content of the element. If the content is empty, then the rendering application may provide another method to reach the destination, e.g. a button or a hyperlink containing the `xlink:href` attribute. The element `ce:inter-ref` does not generate any presentation.
Decoding the URI

The value of the attribute `xlink:href` is a URI-reference. Therefore it is encoded according to the rules for URIs. It is also XML encoded. The URI-encoded `xlink:href` values can be used in web products as follows.

First the XML encoding (character entities) must be resolved, which is automatically done by parsers and other XML tools.

In the http, ftp, or mailto schemes the `xlink:href` values are URLs or email addresses. They can be used directly as URLs in web products.

In the other schemes the `xlink:href` values are not URLs. When URLs are constructed from these values, they must be properly encoded. The identifiers in the `xlink:href` values may contain special characters, esp. & and ?. These characters have a reserved meaning in a URL. Therefore they must be escaped as %26 and %3F.

For example, the following is (theoretically) a valid `xlink:href` value:

doi:10.1049/S0004&3702(02)00193?5

But the following URL, derived from it, is not valid:

http://dx.doi.org/10.1049/S0004&3702(02)00193?5

The valid form of the derived URL is

http://dx.doi.org/10.1049/S0004%263702(02)00193%3F5

Linking services

The `xlink:href` attribute uses a number of privately defined schemes, which can only be resolved by special algorithms containing knowledge of the specific scheme. Often such an algorithm resolves the `ce:inter-ref` element to a hyperlink on the web with an http URL. Collections of such resolved hyperlinks may be held in linking services. The links in such services are so-called third-party links, one end of which is the `ce:inter-ref` element in the article, the other end being the resolved URL. To make it easier to use a `ce:inter-ref` element as a link end for such third-party links, it has a required ID attribute.

Copy edit considerations

The value of the attribute `xlink:href` is a URI-reference. Therefore it must be encoded according to the rules for URIs. After its URI-encoded form has been determined, it must also be XML encoded, i.e., the XML-reserved characters must be encoded as character entities, esp. & must be encoded as &amp;.

In the http, ftp, or mailto schemes the `xlink:href` values are URLs or email addresses. It may be assumed that the URL as given by the author in the manuscript is correct, and can be inserted as is in the XML file, after XML encoding (esp. &).

It is useful to check whether the general form of the URL is correct. http and ftp URLs have the following general form:

http://server.domain.cy/path/to/file?arg1=value1&arg2=value2#name

where the CGI arguments (the part between the ? and the #) and the fragment identifier (the part after the #) are optional. A mailto email address has the following general form:

mailto:i.person@domain.cy
For the other URI schemes, aoi, doi, fiz, genbank, pii, arxiv, and sid, usually only the identifier is given in the manuscript, and the proper URI form must be determined. The following rules are applicable.

- The URI-encoded form of the identifier may only consist of alphanumeric characters and characters from the set
  
  "-" | "_" | "/" | "." | ":" | "," | "(" | ")"

- In addition, in URIs of the doi, arxiv, and sid schemes, the character "/" may appear, as follows:
  
  doi. doi:10.publid/identifier
  arxiv. arxiv:/category/number
  sid. sid:pii/fid

- All other characters must be escaped. The escaped form is of the form \%hex, where \%hex denotes the hexadecimal ASCII value of the character, e.g. \%3A for the colon and \%20 for the space.

For example, the FIZ identifier 85:2535122 and the astronomical object 'LC 123' must be marked up with the following xlink:href values:

xlink:href="fiz:85%3A2535122"

xlink:href="aoi:LC%20123"

**Version history**

As of CEP 1.1.5, the inter-ref scheme pii is deprecated.

<!ATTLIST ce:inter-ref-title xlink:type ( title ) #FIXED "title">
```

**Description**

The *ce:inter-ref-title* element contains the text for one destination, to show for the parent *ce:inter-ref-end* element when multiple links are shown in a selection list.

**Usage**

See *ce:inter-refs*.
ce:inter-refs

Declaration

Model (CEPs 1.1.0–1.1.6)
<!ELEMENT ce:inter-refs (ce:inter-refs-text?, ce:inter-ref-end+, ce:inter-refs-link )>
<!ATTLIST ce:inter-refs xlink:type ( extended ) #FIXED "extended">

Model (CEP 1.2.0)
<!ELEMENT ce:inter-refs (ce:inter-refs-text?, ce:inter-ref-end+, ce:inter-refs-link )>
<!ATTLIST ce:inter-refs id ID #IMPLIED xlink:type ( extended ) #FIXED "extended">

Description

The ce:inter-refs element is the one-to-many-links version of ce:inter-ref, q.v. It is an extended link according to the XLink standard.

Usage

The ce:inter-refs element contains a ce:inter-refs-text element, one or more ce:inter-ref-end elements and a ce:inter-refs-link element.

The ce:inter-refs-text element contains the text that is popularly seen as “text to click on”; it may be absent. It is the text seen in a rendering of the document, e.g. “Parts I–IV”. Both the hyperlinks to the individual destinations and descriptive labels (e.g., “Part III”) are included in the other subelements of the parent ce:inter-refs.

Each ce:inter-ref-end element denotes a link target. Its attribute xlink:href determines the actual link. Its attribute xlink:role is used to indicate what kind of object is to be expected at the other end of the link. Both attributes follow the same rules as the attributes of the same name of ce:inter-ref, q.v. The subelement ce:inter-ref-end contains an optional ce:inter-ref-title element, whose content is the text to show for this link when multiple links are shown in a selection list.

The ce:inter-refs-link element is empty. Its presence is required by the XLink standard.

XML
<ce:inter-refs>
<ce:inter-refs-text id="interref3">
AI631510–AI631512</ce:inter-refs-text>
<ce:inter-ref-end xlink:href="genbank:AI631510">
<ce:inter-ref-title>AI631510</ce:inter-ref-title>
</ce:inter-ref-end>
<ce:inter-ref-end xlink:href="genbank:AI631511">
<ce:inter-ref-title>AI631511</ce:inter-ref-title>
</ce:inter-ref-end>
<ce:inter-ref-end xlink:href="genbank:AI631512">
<ce:inter-ref-title>AI631512</ce:inter-ref-title>
</ce:inter-ref-end>
</ce:inter-refs>
XLink aspects

c:inter-refs has an attribute xlink:type with the fixed value extended. This makes it into an extended link according to the XLink standard. Its child elements also have several fixed xlink attributes, which determine their XLink meaning, in compliance with the XLink standard. Thus c:inter-refs can be processed by general XLink software.

The same example, with all fixed attributes shown explicitly:

XML

```xml
<ce:inter-refs xlink:type="extended">
  <ce:inter-refs-text id="interref3" xlink:type="resource"
    xlink:label="inter-refs-start">AI631510–AI631512</ce:inter-refs-text>
  <ce:inter-ref-end xlink:type="locator"
    xlink:label="inter-ref-end" xlink:href="genbank:AI631510">
    <ce:inter-ref-title xlink:type="title">AI631510</ce:inter-ref-title>
  </ce:inter-ref-end>
  <ce:inter-ref-end xlink:type="locator"
    xlink:label="inter-ref-end" xlink:href="genbank:AI631511">
    <ce:inter-ref-title xlink:type="title">AI631511</ce:inter-ref-title>
  </ce:inter-ref-end>
  <ce:inter-ref-end xlink:type="locator"
    xlink:label="inter-ref-end" xlink:href="genbank:AI631512">
    <ce:inter-ref-title xlink:type="title">AI631512</ce:inter-ref-title>
  </ce:inter-ref-end>
  <ce:inter-refs-link xlink:type="arc"
    xlink:from="inter-refs-start" xlink:to="inter-ref-end"/>
</ce:inter-refs>
```

Its interpretation in terms of the XLink standard is as follows. A link is indicated from the current position (the local resource) to some other positions not in this document (the remote resources).

The c:inter-refs-text element is the local resource, which is indicated by its attribute xlink:type="resource".

The c:inter-ref-end elements are the remote resources, which is indicated by their xlink:type="locator" attribute.

The actual links are created by the c:inter-refs-link element, which is indicated by its xlink:type="arc" attribute. It links from xlink:from="inter-refs-start" to xlink:to="inter-ref-end". The former points to the c:inter-refs-text element, which has the xlink:label="inter-refs-start" attribute. The latter points to
both `ce:inter-ref-end` elements, which both have the `xlink:label="inter-ref-end"` attribute.

Each of the `ce:inter-ref-end` elements has an optional `ce:inter-ref-title` element, with an `xlink:type="title"` attribute. They serve as a human readable title of the `ce:inter-ref-end` element, making it easier for applications to create the selection list for one-to-many links.

**Linking services**

The same considerations regarding linking services apply as for `ce:inter-ref`, *q.v.* The `ce:inter-ref-title` has a required ID attribute, since it is the local resource, which can be the link end of third-party links.

**Version history**

The `id` attribute was added in CEP 1.2.0.

**Rendering notes**

The text contained in `ce:inter-refs-text` appears in any rendering. The destinations contained in `ce:inter-ref-title` can be used to obtain a selection list.

<!ELEMENT ce:inter-refs-link EMPTY>
<!ATTLIST ce:inter-refs-link
xlink:type ( arc ) #FIXED "arc"
xlink:from ( inter-refs-start ) #FIXED "inter-refs-start"
xlink:to ( inter-ref-end ) #FIXED "inter-ref-end">

Description

The ce:inter-refs-link element is empty. Its presence in ce:inter-refs is required by the XLink standard.

Usage

See ce:inter-refs.
**ce:inter-refs-text**

### Declaration

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT ce:inter-refs-text ( %text.data; )*>
<!ATTLIST ce:inter-refs-text
id ID #IMPLIED
xlink:type ( resource ) #FIXED "resource"
xlink:label ( inter-refs-start ) #FIXED "inter-refs-start">
```

### Description

The `ce:inter-refs-text` element contains the text that is popularly seen as “text to click on” within a `ce:inter-refs` element. Clicking on this text may lead to more than one destination.

### Usage

See `ce:inter-refs`.
**ce:intra-ref**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT ce:intra-ref (%text.data;)*>
<!ATTLIST ce:intra-ref
    id ID #IMPLIED
    xlink:type ("simple") #FIXED "simple"
    xlink:role CDATA #IMPLIED
    xlink:href CDATA #REQUIRED>
```

**Description**

The `ce:intra-ref` element is used to reference an object “under control of the publisher”. Examples are cross-references to destinations within other chapters of the same book. The `ce:intra-ref` element is a simple link according to the XLink standard.

**Usage**

The `ce:intra-ref` element is a versatile element used to refer to foreign objects under control of the publisher. Its content is popularly seen as “text to click on”, but it may be empty. The target, given in the attribute `xlink:href` must be outside the document that contains `ce:intra-ref`.

An example is a cross-reference to a section in another chapter of a book. The element `ce:cross-ref` cannot be used, since the destination ID must be in the same file.

While `ce:inter-ref` takes the user out of the application, `ce:intra-ref` remains within the realm of the application; in practice, the destination will be within the same book or serial issue. In such cases, the XML validation tools, run on the whole collection of files belonging to the book, check that the destination IDs exist. However, the application must not assume that the target is in existence in the application. The application activates the link when the target document is present.

The attribute `xlink:href` determines the actual link. The attribute `xlink:role` is used to indicate what kind of object is to be expected at the other end of the link. Both attributes follow the same general rules as the attributes of the same name of `ce:inter-ref`, *q.v.* In the element `ce:intra-ref` there are only two valid values for the scheme in `xlink:href`: pii and doi. These schemes do not allow a value for the `xlink:role` attribute.

```xml
<ce:intra-ref id="intraref1"
    xlink:href="pii:S0140-6736(05)70368-8">...
</ce:intra-ref>
```

The pii scheme is most commonly used for referring to destinations within other chapters of the same book. The destination ID is found after the #.

```xml
<ce:intra-ref id="intraref2"
    xlink:href="pii:S0004-3702(02)00193-5">...
</ce:intra-ref>
```

```xml
<ce:intra-ref id="intraref3"
    xlink:href="pii:S0004-3702(02)00193-5#sec7">...
</ce:intra-ref>
```
Chapter 8 – The Elements of the CEP

Relation with DTD 4

The element `intra-ref` of DTD 4.3 and earlier was used in the context of linked textboxes. Since linked textboxes are now an integral part of the item, `ce:cross-ref` can be used for that purpose.

XLink aspects

`ce:intra-ref` has an attribute `xlink:type` with the fixed value `simple`. This makes it into a simple link according to the XLink standard. The `xlink:href` and `xlink:role` attributes comply with the XLink requirements for a simple link. Thus `ce:intra-ref` can be processed by general XLink software. For more information, see `ce:inter-ref`.

Rendering notes

If the rendering application cannot deal with `ce:intra-ref`, or the scheme in `xlink:href`, it should not complain and merely output the content of the element. If the content is empty, then the rendering application may provide another method to reach the destination, e.g. a button or a hyperlink containing the `xlink:href` attribute. The element `ce:intra-ref` does not generate any presentation.

Version history

Prior to DTD 5.0, `intra-ref` used a location mechanism based on entities. It was only useful for cross-referencing between linked textboxes and the main document. Linked textboxes are now included in the main file itself, and the usage has changed to cross-references between book chapters, indexes, etc.

As of CEP 1.1.5, the intra-ref scheme doi is deprecated.

Description

The `ce:intra-ref-title` element contains the text for one destination, to show for the parent `ce:intra-ref-end` element when multiple links are shown in a selection list.

Usage

See `ce:intra-refts`.
ce:intra-refs

Declaration

Model (CEPs 1.1.0–1.1.6)

```xml
<!ELEMENT ce:intra-refs ( ce:intra-refs-text, ce:intra-ref-end+, ce:intra-refs-link )>
<!ATTLIST ce:intra-refs
default xlink:type ( extended ) #FIXED "extended">
```

Model (CEP 1.2.0)

```xml
<!ELEMENT ce:intra-refs ( ce:intra-refs-text, ce:intra-ref-end+, ce:intra-refs-link )>
<!ATTLIST ce:intra-refs
default xlink:type ( extended ) #FIXED "extended">
```

Description

The ce:intra-refs element is the one-to-many-links version of ce:intra-ref, q.v. It is an extended link according to the XLink standard.

Usage

The function of the element ce:intra-refs is identical to ce:inter-refs, but the existence of the destinations is guaranteed. This is similar to the simple-link variant ce:intra-ref.

The ce:intra-refs element contains a ce:intra-refs-text element, one or more ce:intra-ref-end elements and a ce:intra-refs-link element.

The ce:intra-refs-text element contains the text that is popularly seen as “text to click on”; it may be absent. It is the text seen in a rendering of the document, e.g. “[37, Sections 7–10]”. Both the hyperlinks to the individual destinations and descriptive labels (e.g., “[37, Section 9]”) are included in the other subelements of the enclosing ce:intra-refs.

Each ce:intra-ref-end element denotes a link target. Its attribute xlink:href determines the actual link. Its attribute xlink:role is used to indicate what kind of object is to be expected at the other end of the link. Both attributes follow the same rules as the attributes of the same name of ce:intra-ref, q.v. The subelement ce:intra-ref-end contains an optional ce:intra-ref-title element, whose content is the text to show for this link when multiple links are shown in a selection list.

The ce:intra-refs-link element is empty. Its presence is required by the XLink standard.

```xml
<ce:intra-refs id="iars263">
  <ce:intra-refs-text id="intraref8">Figs. 1 and 2 in Chapter 2</ce:intra-refs-text>
  <ce:intra-ref-end xlink:href="pii:S0167-8396(00)00009-1#fig1">
    <ce:intra-ref-title>Fig. 1</ce:intra-ref-title>
  </ce:intra-ref-end>
  <ce:intra-ref-end xlink:href="pii:S0167-8396(00)00009-1#fig2">
    <ce:intra-ref-title>Fig. 2</ce:intra-ref-title>
  </ce:intra-ref-end>
</ce:intra-refs>
```

340 Elsevier Documentation for the XML DTD 5 Family
XLink aspects

`ce:intra-refs` has an attribute `xlink:type` with the fixed value `extended`. This makes it into a extended link according to the XLink standard. Its child elements also have several fixed `xlink` attributes, which determine their XLink meaning, in compliance with the XLink standard. Thus `ce:intra-refs` can be processed by general XLink software. Please refer to `ce:inter-refs`, where a more detailed illustration is given.

Linking services

The same considerations regarding linking services apply as for `ce:intra-ref`, *q.v.* The `ce:intra-ref-title` has a required ID attribute, since it is the local resource, which can be the link end of third-party links.

Version history

The `id` attribute was added in CEP 1.2.0.

Rendering notes

The text contained `ce:inter-ref-text` appears in any rendering. The destinations contained in `ce:inter-ref-title` can be used to obtain a selection list.

**ce:italic**

**Declaration**

**Model** *(CEPs 1.1.0–1.2.0)*

```xml
<!ELEMENT ce:italic ( %richstring.data; )*>
```

**Description**

The element *ce:italic* is a font changing element *(p. 171)*. It is used to obtain italic.

**Usage**

**XML**

```xml
<ce:italic>This text is in italic</ce:italic>
```

**Presentation**

*This text is in italic*

Formulae should be captured in MathML. This is not enforced for very simple formulae — these can be structured with text effect elements.

**XML**

```xml
<mml:math>
  <mml:mrow>
    <mml:mi>p</mml:mi>
    <mml:mo>+</mml:mo>
    <mml:mi>q</mml:mi>
    <mml:mo>=</mml:mo>
    <mml:mi>r</mml:mi>
  </mml:mrow>
</mml:math>
```

**Presentation**

*p + q = r*

**Version history**

Prior to DTD 5.0, this element was called *it*.

**See also**

For more information see the section on **text effects** *(p. 171)*. See also *ce:bold, ce:cross-out, ce:monospace, ce:sans-serif, ce:small-caps, ce:underline*.

```

Model (CEP 1.1.5)

```xml
<!ELEMENT ce:keywords (ce:section-title?, ce:keyword+)>
<!ATTLIST ce:keywords
class CDATA "keyword" xml:lang %iso639; #IMPLIED>
```

Model (CEP 1.1.6)

```xml
<!ELEMENT ce:keywords (ce:section-title?, ce:keyword+)>
<!ATTLIST ce:keywords
class CDATA "keyword" xml:lang %iso639; #IMPLIED>
```

Model (CEP 1.2.0)

```xml
<!ELEMENT ce:keywords (ce:section-title?, ce:keyword+)>
<!ATTLIST ce:keywords
class CDATA "keyword" xml:lang %iso639; #IMPLIED>
```

Description

Sets of keywords form a keyword group, ce:keywords, which may occur in various classes in an article.

Usage

A keyword group consists of a sequence of keywords or classification codes, ce:keyword. Keywords can be nested one level deep.

The element ce:keywords has four attributes. The language of the keywords (if applicable), if different from the language of the article, should be specified in the xml:lang attribute. See ISO 639 set of entities (p. 178) for an overview of the allowed language codes.

The id can be used to uniquely identify the keyword group. The attribute view is used to indicate in which views the keyword group must appear. Its default is to appear in all views. See also the section Views (p. 179).

The type of keywords or classification scheme is given by the attribute class. This attribute is of type CDATA so that additional values can be added without a DTD update. The only values allowed for class are described below.
• **Keyword** is the default. It is used for ordinary keywords. Second-order keywords can be captured using a nested keyword.

  XML
  ```xml
  <ce:keywords>
    <ce:section-title>Keywords</ce:section-title>
    <ce:keyword><ce:text>Electroplating</ce:text></ce:keyword>
    <ce:keyword><ce:text>Electrodeposited photoresist</ce:text></ce:keyword>
    <ce:keyword><ce:text>3D fabrication</ce:text></ce:keyword>
  </ce:keywords>
  ```

  Presentation
  Keywords: Electroplating; Electrodeposited photoresist; 3D fabrication

• **Abr** is used for abbreviations in an abbreviation list. Similar to **ce:nomenclature**, these are the abbreviations used in a document. They are printed at the bottom of the first page of the article like a footnote.

  XML
  ```xml
  <ce:keywords class="abr">
    <ce:section-title>Abbreviations</ce:section-title>
    <ce:keyword>
      <ce:text>mtDNA</ce:text><ce:keyword><ce:text>mitochondrial DNA</ce:text></ce:keyword>
    </ce:keyword>
    <ce:keyword><ce:text>WT</ce:text><ce:keyword><ce:text>wildtype</ce:text></ce:keyword>
    <ce:keyword><ce:text>GFP</ce:text><ce:keyword><ce:text>green fluorescent protein</ce:text></ce:keyword>
  </ce:keywords>
  ```

  Presentation
  Abbreviations: mtDNA, mitochondrial DNA; WT, wildtype; GFP, green fluorescent protein.

• **Astronomy** is used for controlled astronomical keywords, taken from the astronomical thesaurus, used, e.g., in *New Astronomy*. This class replaces the default class **keyword**, which therefore may not be used.

  XML
  ```xml
  <ce:keywords class="astronomy">
    <ce:section-title>Keywords</ce:section-title>
    <ce:keyword><ce:text>Cosmic microwave background</ce:text></ce:keyword>
    <ce:keyword><ce:text>Cosmology: theory</ce:text></ce:keyword>
  </ce:keywords>
  ```

  Presentation
  Keywords: Cosmic microwave background; Cosmology: theory

• **Cell** is to be used for a forthcoming classification scheme used in *Cell*.

• **Cras-terre** is used for the subject classification used in the journals of the *Comptes Rendues de l'Académie des Sciences* collection. Each consists of a keyword, or a
keyword and a subkeyword.

XML

```xml
<ce:keywords class="cras-terre">
  <ce:keyword>
    <ce:text>Géochimie</ce:text>
  </ce:keyword>
  <ce:keyword>
    <ce:text>Géosciences de surface</ce:text>
  </ce:keyword>
</ce:keywords>
```

**Presentation**

Géochimie / Géosciences de surface  
Geochemistry / Surface Geosciences

- **ctsnet** is used for the CTSNet classifications (Cardiothoracic Surgery Network, www.ctsnet.org). These keywords may not be nested and are not necessarily presented in a rendering application.

XML

```xml
<ce:keywords class="ctsnet">
  <ce:section-title>CTSNet classification</ce:section-title>
  <ce:keyword><ce:text>22</ce:text></ce:keyword>
  <ce:keyword><ce:text>23</ce:text></ce:keyword>
</ce:keywords>
```

**Presentation**

CTSNet classification: 22; 23

- **emtree** is used for controlled keywords from the EMTREE thesaurus.
- **geo** is used for controlled keywords from the geo thesaurus as used in EPSL Online. This class replaces the default class keyword, which therefore may not be used.

XML

```xml
<ce:keywords class="geo">
  <ce:section-title>Keywords</ce:section-title>
  <ce:keyword>
    <ce:text>fission-track dating</ce:text>
  </ce:keyword>
  <ce:keyword>
    <ce:text>uranium disequilibrium</ce:text>
  </ce:keyword>
</ce:keywords>
```

**Presentation**

Keywords: fission-track dating; uranium disequilibrium

- **idt** (index terms) is used for entries in a subject index. These keywords may not be nested and are not presented in a rendering of the item itself. By combining the
• *inchikey* is used for InChIKeys. An InChIKey is a hashed version of an InChI, an IUPAC International Chemical Identifier. InChIKeys are not shown in print nor in PDF files.

```xml
<ce:keywords class="inchikey">
  <ce:section-title>InChIKeys</ce:section-title>
  <ce:keyword>
    <ce:text>WHUUTDBJXJRKMK-MYXYCAHRS-A</ce:text>
  </ce:keyword>
</ce:keywords>
```

• *inspec-cc* is used for INSPEC classification codes (www.iee.org.uk). Keywords in this class may not be nested.

```xml
<ce:keywords class="inspec-cc">
  <ce:section-title>Classification codes</ce:section-title>
  <ce:keyword><ce:text>A0470</ce:text></ce:keyword>
  <ce:keyword><ce:text>A9760L</ce:text></ce:keyword>
</ce:keywords>
```

Presentation

Classification codes: A0470; A9760L

• *inspec-ct* is used for INSPEC classification terms (www.iee.org.uk). Keywords in this class may not be nested.

```xml
<ce:keywords class="inspec-ct">
  <ce:section-title>Thesaurus terms</ce:section-title>
  <ce:keyword><ce:text>accelerator-based transmutation</ce:text></ce:keyword>
  <ce:keyword><ce:text>haptic interfaces</ce:text></ce:keyword>
</ce:keywords>
```

Presentation

Thesaurus terms: accelerator-based transmutation; haptic interfaces

• *inspec-chi* is used for INSPEC chemical index terms. Keywords in this class may not be nested.

```xml
<ce:keywords class="inspec-chi">
  <ce:section-title>Chemical index</ce:section-title>
  <ce:keyword><ce:text>LaMnO3/ss</ce:text></ce:keyword>
  <ce:keyword><ce:text>La/ss</ce:text></ce:keyword>
  <ce:keyword><ce:text>Mn/ss</ce:text></ce:keyword>
  <ce:keyword><ce:text>O3/ss</ce:text></ce:keyword>
  <ce:keyword><ce:text>O/ss</ce:text></ce:keyword>
</ce:keywords>
```

Presentation

Chemical index: LaMnO3/ss; La/ss; Mn/ss; O3/ss; O/ss

• *jel* is a subject classification used in Economics, based on the classification used by the *Journal of Economics Literature* (www.aeaweb.org). These keywords may not be nested.
Chapter 8 – The Elements of the CEP

XML

<ce:section-title>JEL classification</ce:section-title>

• src is used for entries in a “Sources” index. These keywords may not be nested and are not necessarily presented in a rendering application.

• stma is used for STMA (Statistical Theory & Methods Abstracts, www.cbs.nl/isi) classification codes. These keywords may not be nested.

XML
Presentation

Statistical Theory and Method Abstracts: 00:050; 06:900

- *thelancet* is to be used for a forthcoming classification scheme used in *The Lancet*.

**Version history**

Prior to DTD 5.0, this element was called `kwdg`. In CEP 1.1.1 the value `it` was added to parameter entity `%language;`. As of CEP 1.1.5, all languages contained in `%iso639;` are allowed. The `view` attribute was added in CEP 1.1.6, while the `id` attribute was added in CEP 1.2.0.

**See also**

`ce:keyword`
ce:label

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:label ( %text.data; )*>

Description

The designation (number, name, label) of various elements is contained in the ce:label element.

Usage

The ce:label element is used to contain the designation of the parent element, e.g. “2.1.6”, “Fig. 2”, “Plate VII” or “Lemma 1.6”.

XML

<ce:affiliation id="aff2">b</ce:label> ...  
<ce:footnote id="fn4">4</ce:label> ...  
<ce:section id="sec2">2</ce:label> ...  
<ce:section id="sec3.1">3.1</ce:label> ...  
<ce:enunciation id="lem1.6">Lemma 1.6</ce:label> ... 

Presentation

b. Affiliation...
4. Footnote...
2. Section...
3.1. Section...
Lemma 1.6...

Explanation

Note that ce:label generates some presentation: the closing full stops and the superscript position of the footnote number are generated by the ce:label, whereas they would have to be inserted explicitly in a ce:cross-ref. This allows the application to build cross-reference destination lists directly from the content of ce:label.

For explanation of the precise usage of ce:label, refer to the parents.

The element ce:label plays an important role in cross-referencing, especially for one-to-many links.

Version history

Prior to DTD 5.0, this element was called no.

See also

For more information, see the parent elements, the section Cross-references and the label element (p. 167), ce:cross-ref.
Chapter 8 – The Elements of the CEP

**ce:last-page**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT ce:last-page ( %richstring.data; )*>
```

**Description**

The last page of an item called by a hub file is captured using **ce:last-page**.

**Usage**

See **ce:pages**.

**Version history**

This element was added in CEP 1.1.0.

**See also**

- **ce:include-item**
- **ce:include-item**
ce:legend

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT ce:legend ( ce: simple-para+ )>

Description

A ce:legend contains explanatory text belonging to a table.

Usage

A legend appears at the bottom of a table. It contains one or more simple paragraphs, ce: simple-para. It is an extension to the CALS table model.

For more information about tables, see ce:table.

See also

ce:table-footnote
**ce:link**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT ce:link EMPTY>
<!ATTLIST ce:link
  id ID #IMPLIED
  locator ENTITY #REQUIRED>
```

**Description**

For the purpose of referring to external files, the general element `ce:link` is provided.

**Usage**

The element `ce:link` instructs the rendering application to pull in an external file, e.g. an artwork file or an audio file. What needs to be done with the external file depends on the parent element. Such external files belonging to the XML file are called *assets*.

`ce:link` has one mandatory attribute `locator` which is an entity declared in the document’s declaration subset as an external file. From that entity declaration, the application retrieves the type of the external file: APPLICATION, AUDIO, IMAGE, TEXT, VIDEO or XML.

The name of the entity is irrelevant; the name of the file, however, is.

**XML**

```xml
<ENTITY fx22 SYSTEM "fx22" NDATA IMAGE>
...
<ce:inline-figure><ce:link locator="fx22"/></ce:inline-figure>
...
```

In this example, `ce:link` tells the rendering application which external file must be used to render the inline figure. This is done through the entity `fx22` which is an image file with file name (without extension) `fx22`. A separate catalog file redirects the rendering application to the correct file, e.g. `fx22.tif`.

**Version history**

As from CEP 1.1.2 the attribute list no longer contains file-size information.

**See also**

*Entities and the DOCTYPE declaration* (p. 14).
Chapter 8 – The Elements of the CEP

ce:list

Declaration

Model (CEPs 1.1.0–1.1.5)

```xml
<!ELEMENT ce:list ( ce:label?, ce:section-title?,
                  ce:list-item+ )>
<!ATTLIST ce:list
         id ID #IMPLIED>
```

Model (CEPs 1.1.6, 1.2.0)

```xml
<!ELEMENT ce:list ( ce:label?, ce:section-title?,
                  ce:list-item+ )>
<!ATTLIST ce:list
         id ID #IMPLIED
         role CDATA #IMPLIED>
```

Description

The element `ce:list` is used to capture free-format lists.

Usage

The element `ce:list` provides a way to capture lists, where the labels are left entirely to the user.

A `ce:list` has an optional number or label (`ce:label`) and an optional section title (`ce:section-title`). It has an optional `id` attribute so that it can become the target of a cross-reference.

A list consists of one or more list items, `ce:list-item`. Each list item can have a `ce:label`, containing the list item’s label, and consists of one or more paragraphs, `ce:para`. If the `ce:label` element is absent, then the item is indented, and the result is a “tab list”.

A `ce:list-item` can have an `id` so that it can become the target of a cross-reference.

```xml
<ce:list id="lst003">
  <ce:list-item id="lsti007">
    <ce:label>(iii)</ce:label>
    <ce:para>Item 3...</ce:para>
  </ce:list-item>
  <ce:list-item id="lsti008">
    <ce:label>(iv)</ce:label>
    <ce:para>Item 4...</ce:para>
  </ce:list-item>
</ce:list>
```

```xml
<ce:list id="lst004">
  <ce:list-item id="lsti010">
    <ce:label>&rtrif;</ce:label>
    <ce:para>Item ...</ce:para>
  </ce:list-item>
</ce:list>
```
Version history

Prior to DTD 5.0, lists with auto-generated labels could be obtained with the `li` element. The `role` attribute was added in CEP 1.1.6.

See also

cdef-list
**ce:list-item**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```
<!ELEMENT ce:list-item ( ce:label?, ce:para+ )>
<!ATTLIST ce:list-item
  id ID #IMPLIED>
```

**Description**

The element `ce:list-item` is used to capture list items within `ce:list`.

**Usage**

See `ce:list`. 
### ce:marker

#### Declaration

**Model (CEPs 1.1.0.1–1.2.0)**

```xml
<!ELEMENT ce:marker EMPTY>
<!ATTLIST ce:marker
  name CDATA #REQUIRED
  alt CDATA #REQUIRED
  altimg CDATA #REQUIRED
  altimg-small CDATA #REQUIRED>
```

#### Description

A marker is a small icon which marks a special property of an article. Examples are: ‘Fast track article’, ‘Continuous Medical Education (CME) article’. The marker is usually shown in the Table of Contents of an issue, before or after the title, and on the first page of an article.

#### Usage

The marker icons are pixel perfect gif files, similarly to all other altimages.

The **name** attribute contains a name for the marker, which allows one to categorize articles with such markers. Applications should ignore marker names unknown to them.

The **alt** attribute contains an alternative text for the marker icon. The text should be a short indication of the category of articles marked by this marker.

The **altimg** attribute contains the name of the marker icon.

The **altimg-small** attribute contains the name of a smaller-sized version of the marker icon. This version should be used when the marker is printed inline, especially with the article title in the Table of Contents.

```xml
<ce:markers>
  <ce:marker name="cme"
    alt="Continuous Medical Education"
    altimg="cme_o.gif" altimg-small="cme_s.gif"/>
  <ce:marker name="swift"
    alt="Fast Track Article"
    altimg="swift_o.gif" altimg-small="swift_s.gif"/>
</ce:markers>
```

**Explanation**

This article has two markers, one indicating that it contains Continuous Medical Education material, the other indicating that it is a fast-track article. The alt texts show these meanings as a tool-tip if the icons are not displayed. The icons are delivered in two sizes, called “online” and “small”. There is no indication of the actual sizes.

The normal-sized icon is to be shown on the first page of the article. The small icon is to be used inline in the Table of Contents.
Light reading

A marker should not be used for article features which can be derived from the article’s content, such as the presence of e-extra material. If web platforms wish to show a marker for such features, they should generate it based on programmatic inspection of the article.

Version history

This element was added in CEPs 1.1.0.1 and 1.1.4.
ce:markers

Declaration

Model (CEPs 1.1.0.1–1.2.0)

<!ELEMENT ce:markers ( ce:marker+ )>

Description

An article may contain multiple ce:marker elements. These are contained in the element ce:markers.

Usage

See ce:marker.

Version history

This element was added in CEPs 1.1.0.1 and 1.1.4.

See also

ce:marker
Chapter 8 – The Elements of the CEP

ce:miscellaneous

Declaration

Model (CEPs 1.1.0–1.1.5)
<!ELEMENT ce:miscellaneous ( %text.data; )*>

Model (CEP 1.1.6)
<!ELEMENT ce:miscellaneous ( %text.data; )*>
<!ATTLIST ce:miscellaneous role CDATA #IMPLIED>

Model (CEP 1.2.0)
<!ELEMENT ce:miscellaneous ( %text.data; )*>
<!ATTLIST ce:miscellaneous id ID #IMPLIED
role CDATA #IMPLIED>

Description

The ce:miscellaneous element is used to capture miscellaneous history information of the article. It is an optional element within the frontmatter.

Usage

Miscellaneous history information is contained in ce:miscellaneous. The most common information captured using this element is the communicating editor. In principle, each journal can have its own convention.

XML
<ce:miscellaneous id="m1">Communicated by M. Nivat</ce:miscellaneous>

Presentation
Communicated by M. Nivat

Rendering notes

ce:miscellaneous does not generate any text.

Version history

Prior to DTD 5.0, this element was called misc. The role attribute was added in CEP 1.1.6, while the id attribute was added in CEP 1.2.0.
**ce:monospace**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT ce:monospace (%richstring.data;)>  
```

**Description**

The element **ce:monospace** is a font changing element (p. 171). It is used to obtain a monospaced typewriter font.

**Usage**

To obtain a monospaced “typewriter” font, the element **ce:monospace** is used.

**XML**

```xml
<ce:monospace>
  &lt;ce:monospace&gt;Monospace font&lt;/ce:monospace&gt;
</ce:monospace>
```

**Presentation**

```xml
<ce:monospace>Monospace font</ce:monospace>
```

In combination with text tables or tab lists **ce:monospace** is popular for capturing computer code fragments; this is also known as verbatim text. To obtain multiple spaces use sequences of nonbreakable spaces `&amp;#x00A0;`.

**Version history**

Prior to DTD 5.0, this element was called `ty`.

**See also**

For more information see the section on **text effects** (p. 171). See also **ce:bold, ce:cross-out, ce:italic, ce:sans-serif, ce:small-caps, ce:underline**.

Similar constructs to capture this information are ce:keywords with class equal to abr and ce:glossary.
**ce:note**

**Declaration**

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:note ( ce: simple-para+ )>
```

**Description**

Within structured bibliographic references, `ce:note` contains descriptive paragraphs about the reference. It can also contain an endnote.

**Usage**

A `ce:note` contains one or more paragraphs, `ce: simple-para`. In a structured reference, it can occur on its own or after a bibliographic reference. On its own, it is effectively an "endnote", which may coexist beside footnotes and are listed between bibliographic references. After a bibliographic reference, it contains descriptive text about the reference, not to be confused with an `sb:comment`.

**XML**

```xml
<ce:bib-reference id="bib49">
  <ce:label>[49]</ce:label>
  <sb:reference id="sbr62">
    <sb:comment>See the references in</sb:comment>
    <sb:contribution>...</sb:contribution>
    <sb:comment>first published in</sb:comment>
    <sb:host>...</sb:host>
    <sb:comment>also available electronically as</sb:comment>
    <sb:host>...</sb:host>
    <sb:comment>(in Japanese)</sb:comment>
  </sb:reference>
  <ce:note>
    <ce:simple-para id="sp82">This reference explains the usage of the comment and note elements. Comments and the other components of the sb:reference together form one text. The note may contain details about the reference.</ce:simple-para>
  </ce:note>
</ce:bib-reference>

<ce:bib-reference id="bib50">
  <ce:label>[50]</ce:label>
  <ce:note>
    <ce:simple-para id="ssp83">This is a note in between the references, an endnote.</ce:simple-para>
  </ce:note>
</ce:bib-reference>
```

**Presentation**

[49] See the references in ... first published in ... also available electronically as ... (in Japanese).

This reference explains the usage of the comment and note elements. Comments and the other components of the sb:reference together form one text. The note may contain details about the reference.

[50] This is a note in between the references, an endnote.
See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
ce:note-para

Declaration

Model (CEPs 1.1.0–1.1.4)

```xml
<!ELEMENT ce:note-para ( %note.data; )*>
<!ATTLIST ce:note-para
id ID #IMPLIED>
```

Model (CEP 1.1.5)

```xml
<!ELEMENT ce:note-para ( %note.data; )*>
<!ATTLIST ce:note-para
id ID #IMPLIED>
```

Model (CEPs 1.1.6, 1.2.0)

```xml
<!ELEMENT ce:note-para ( %note.data; )*>
<!ATTLIST ce:note-para
id ID #IMPLIED
role CDATA #IMPLIED
view %view; 'all'>
```

Description

Paragraphs of text within footnotes and notes, are captured using the element ce:note-para.

Usage

A note paragraph, ce:note-para, belongs to the lowest-level structuring elements. It contains text and objects structured with the elements in %note.data;, and differs from a full paragraph, ce:para, in that footnotes and floating objects are not allowed.

Version history

The role and view attributes were added in CEP 1.1.6.

See also

ce:para, ce:simple-para.
ce:other-ref

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:other-ref ( ce:label?, ce:textref )>
<!ATTLIST ce:other-ref
    id ID #IMPLIED>
```

Description

The element `ce:other-ref` is used to capture bibliographic references that cannot be structured.

Usage

If structuring a bibliographic reference in an `sb:reference` is not possible, then `ce:other-ref` can be used. Known examples are maps and patents, but also incomplete references can be tagged this way. However, the content of `ce:other-ref` must be a bibliographic reference; to create reference lists that also contain endnotes the element `ce:note` can be used.

A bibliographic reference, when tagged using `ce:other-ref`, needs to be marked up according to the journal style, e.g., if a title should be italics, it should explicitly be marked up.

The element `ce:other-ref` has an optional `ce:label` subelement and an `id` attribute. These are used when the `ce:other-ref` is part of a multiple reference.

Copy edit considerations

As noted above, a bibliographic reference tagged with `ce:other-ref` can still contain tagged information. In particular URLs can be tagged (with `ce:inter-ref`).

```xml
<ce:bib-reference id="bib15">
    <ce:label>[15]</ce:label>
    <ce:other-ref id="or15">
        <ce:textref>S. Barrett, QuackWatch, Allentown, PA, USA,
            <ce:inter-ref id="ir94" xlink:href="http://www.quackwatch.org/">
                http://www.quackwatch.org/</ce:inter-ref>
        [accessed March 2003].</ce:textref>
    </ce:other-ref>
</ce:bib-reference>
```

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
ce:pages

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:pages ( ce:first-page, ce:last-page? )>

Description

The pages of an item called by a hub file are captured using ce:pages.

Usage

The element ce:pages contains a mandatory ce:first-page and an optional ce:last-page.

XML

```
<ce:pages>
  <ce:first-page>37</ce:first-page>
  <ce:last-page>81</ce:last-page>
</ce:pages>
```

XML

```
<ce:pages>
  <ce:first-page>L1</ce:first-page>
  <ce:last-page>L13</ce:last-page>
</ce:pages>
```

XML

```
<ce:pages>
  <ce:first-page>iv</ce:first-page>
</ce:pages>
```

The element ce:last-page is not used when the page range spans a single page.

If the document style is to render a page range as 127–9, then the element ce:last-page must contain 129.

Version history

This element was added in CEP 1.1.0.

ce:include-item
Chapter 8 – The Elements of the CEP

**ce:para**

**Declaration**

Model (CEPs 1.1.0–1.1.4)

```
<!ELEMENT ce:para ( %par.data; )*>
<!ATTLIST ce:para
  id ID #IMPLIED
  role CDATA #IMPLIED
  view %view; 'all'>
```

Model (CEPs 1.1.5–1.2.0)

```
<!ELEMENT ce:para( %par.data; )*>
<!ATTLIST ce:para
  id ID #IMPLIED
  role CDATA #IMPLIED
  view %view; 'all'>
```

**Description**

Paragraphs of text are captured using the element `ce:para`.

**Usage**

A paragraph, `ce:para`, belongs to the lowest-level structuring elements. It contains text and objects structured with the elements in `%par.data;`.

The attribute `id` can be used to cross-reference to the paragraph.

The attribute `role` allows one to categorize paragraphs, and attach a special meaning to them. For instance, it makes it possible to mark a paragraph as a “motto”, and handle it in a different way than an ordinary paragraph. Applications should treat roles unknown to them as ordinary paragraphs. The role must belong to a list validated by the XML validation tools. At the time of writing, the following roles exist.

- **acknowledgement** is used to mark acknowledgement-like paragraphs, such as ‘Contributors’, ‘Conflicts of Interest’, etc.
- **author** is used to identify a paragraph which consists of an author’s name. It is only used in book items where the author of a `ce:section` needs to be indicated.
- **background** is used to identify a paragraph that contains background information.
- **case-study** is used to identify a paragraph containing a case study.
- **conclusion** is used to identify a paragraph that contains conclusions.
- **correct-answer** is used to indicate that the paragraph contains a correct answer.
- **discussion** is used to identify a paragraph that contains a discussion.
- **exam-questions** is used to identify the paragraph which contains the actual exam questions. It should only be used for a paragraph in the element `ce:exam-questions`.
- **introduction** is used to mark the introductory paragraphs of an article. Introductory paragraphs are distinguished by some publications, which may print them, e.g., in boldface.
- **motto** is used to turn a paragraph into a motto.

*XML*
<ce:para id="p01" role="motto">Everything has a version number</ce:para>

- question is used to mark a paragraph with a single question and will enforce a special layout.

Items can appear in compact, standard and extended views. The attribute view is used to indicate in which views the paragraph must appear. Its default is to appear in all views. See also the section Views (p. 179).

**Version history**

In CEP 1.1.5 entity %text-objects; was added to %par.data;.

**See also**

ce:note-para, ce:simple-para
ce:pii

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT ce:pii ( %string.data; )*>

Description

The element ce:pii contains the PII of the item.

Usage

Each item must have a PII, a publisher item identifier. To identify the document, ce:pii is populated with the PII of the document. The full PII with formatting characters (e.g. parentheses, hyphens) must be used. The different types of PII are described in [27].

For journal articles, an alternative means of identification is the combination of journal code, jid, and article number, aid.

See also

aid, ce:doi, jid
ce:preprint

Declaration

Model (CEPs 1.1.0–1.2.0)

\[
\text{<!ELEMENT ce:preprint ( ce:inter-ref )>}
\]

Description

The element \textit{ce:preprint} is used to create a link between a document and an associated preprint version.

Usage

Many articles have an associated preprint version, which is stored in a preprint archive. In order to create a link between the article and its associated preprint version, the element \textit{ce:preprint} is provided. It contains one subelement, \textit{ce:inter-ref}, which is the actual link. The content of \textit{ce:inter-ref} is empty in this context.

Only preprints in a pre-defined list of repositories may be referenced, so that correct links can be created. Therefore, only a limited number of values for the scheme in \textit{xlink:href} are allowed. Presently only \textit{arxiv} is used.

\textit{XML}

\[
\begin{align*}
\text{<ce:preprint} \\
\text{  <ce:inter-ref id="interref8"} \\
\text{    xlink:role="http://www.elsevier.com/xml/linking-roles/preprint"} \\
\text{    xlink:href="arxiv:/hep-th/9112009"></ce:inter-ref>} \\
\text{</ce:preprint>}
\end{align*}
\]

Explanation

This generates a link between the article and the associated preprint within the Los Alamos archive, whose URL is \url{http://www.arxiv.org/abs/hep-th/9112009}.

Rendering notes

The element \textit{ce:preprint} generates no output on paper, but in other media, a link with the preprint database may be created.

See also

\textit{ce:inter-ref}
ce:presented

Declaration

Model (CEPs 1.1.0–1.1.6)

<!ELEMENT ce:presented ( %textfn.data; )*>

Model (CEP 1.2.0)

<!ELEMENT ce:presented ( %textfn.data; )*>
<!ATTLIST ce:presented id ID #IMPLIED>

Description

In the head of an item, it is sometimes stated that the article was presented at a certain conference or by a certain person (mostly one of the authors). The ce:presented is provided for this purpose.

Usage

The element ce:presented is an optional subelement of the head. It contains the complete statement identifying the presenter of the article and/or the place where the article was presented.

XML

<ce:presented>Presented by P. Walmsey</ce:presented>

Version history

Prior to DTD 5.0, this element was called prs. The id attribute was added in CEP 1.2.0.

Rendering notes

The text “Presented by” is not generated.
**ce:ranking**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT ce:ranking ( %richstring.data; )*>
```

**Description**

The element **ce:ranking** provides a way to mark “important” authors.

**Usage**

In some scientific disciplines, especially Chemistry, it is common to mark the more important authors. Often, the same symbol is used as the one for corresponding author. If not, or if the particular author is not a corresponding author, **ce:ranking** can be used to capture the symbol. Conversely, it is not required to mark an author using **ce:ranking** if the importance is already signalled in other means. Indeed, it is possible that two authors are “important” but one has **ce:ranking** and the other has a corresponding author footnote (**ce:correspondence**).

**XML**

```xml
<ce:author id="au1">
  <ce:given-name>Jitendra</ce:given-name>
  <ce:surname>Sharma</ce:surname>
  <ce:ranking>*</ce:ranking>
</ce:author>
<ce:author id="au2">
  <ce:given-name>A.</ce:given-name>
  <ce:surname>Angelucci</ce:surname>
  <ce:ranking>*</ce:ranking>
</ce:author>
```

**Presentation**

Jitendra Sharma*, A. Angelucci*

**See also**

**ce:author, ce:correspondence**
ce:reader-see

Declaration

Model (CEPs 1.1.3–1.2.0)

<!ELEMENT ce:reader-see ( %text.data; )*>

Description

The element ce:reader-see is used to capture general references.

Usage

In indexes that are created by professional indexers, “see” or “see also” entries can appear that do not explicitly point to terms in the index, but instead require the reader’s expertise. In the first example below, taken from the Encyclopedia of Food Sciences and Nutrition (Academic Press, San Diego, 2003), the indexer has added an entry “absorption of nutrients” with reference “see specific nutrients”. A human reader can interpret this link, but it is not possible or viable to create a link in the XML file. With the element ce:reader-see such references without a link can be captured.

Unlike the elements ce:see and ce:see-also, no text is generated by ce:reader-see.

XML

<ce:index-entry id="idx012">
  <ce:index-heading>absorption of nutrients</ce:index-heading>
  <ce:reader-see>see <ce:italic>specific nutrients</ce:italic></ce:reader-see>
</ce:index-entry>

XML

<ce:index-entry id="idx037">
  <ce:index-heading>amines</ce:index-heading>
  ...
  <ce:index-entry id="idx038">
    <ce:index-heading>biogenic</ce:index-heading>
    <ce:reader-see>see <ce:italic>individual amines</ce:italic></ce:reader-see>
  </ce:index-entry>
</ce:index-entry>

Version history

This element was added in CEP 1.1.3.
ce:refers-to-document

Declaration

Model (CEPs 1.1.0–1.1.5)

```xml
<!ELEMENT ce:refers-to-document ( ce:doi | ( ce:pii, ce:doi? ) )>
```

Model (CEP 1.1.6)

```xml
<!ELEMENT ce:refers-to-document ( ce:doi | ( ce:pii, ce:doi? ) )>
<!ATTLIST ce:refers-to-document
  role CDATA #IMPLIED>
```

Model (CEP 1.2.0)

```xml
<!ELEMENT ce:refers-to-document ( ce:doi | ( ce:pii, ce:doi? ) )>
<!ATTLIST ce:refers-to-document
  id ID #IMPLIED
  role CDATA #IMPLIED>
```

Description

The element `ce:refers-to-document` is used to refer to another document.

Usage

The element `ce:refers-to-document` consists of a `ce:pii` and/or a `ce:doi`, alternative identifications of one and the same document, which must not be the document in which `ce:refers-to-document` itself occurs. If both PII and DOI are known, then both elements `ce:pii` and `ce:doi` will be present.

It is used to associate the two documents, e.g., to link an erratum with the article that it is an erratum to.

```xml
<ce:refers-to-document>
  <ce:pii>S0031-9201(03)00274-7</ce:pii>
</ce:refers-to-document>
```

Presentation

DOI of original article: http://dx.doi.org/10.1016/j.pepi.2003.12.005.

The attribute `role` allows one to categorize the associations and handle them differently. Currently only the role `predecessor` is defined. It is used to indicate the previous version of an updated item in cases where the original item still exists.

Version history

This element was introduced in CEP 1.1.0 and replaced `ce:refers-to-article`. The `role` attribute was added in CEP 1.1.6, while the `id` attribute was added in CEP 1.2.0.

**ce:roles**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT ce:roles ( %richstring.data; )*>
```

**Description**

A sequence of named roles or job titles appearing after the author name is tagged with `ce:roles`.

**Usage**

Roles or job titles of the author may appear after an author name. These are captured using the `ce:roles` element. Roles or job titles are different from academic titles or degrees, which are part of `ce:degrees`.

```xml
<ce:roles>Chairman</ce:roles>
<ce:roles>Past Treasurer of the ACGIH</ce:roles>
<ce:roles>Editor-in-Chief</ce:roles>
<ce:roles>CEO, Reed&ndash;Elsevier</ce:roles>
```

**See also**

`ce:author, ce:degrees, ce:suffix`
ce:salutation

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:salutation ( %text.data; )*>

Description

If an article begins with a salutation, this can be captured using ce:salutation.

Usage

A salutation may appear at the beginning of the body of an article. It is tagged with ce:salutation.

XML

```xml
<body>
  <ce:salutation>Sir</ce:salutation>
  <ce:sections>
    <ce:section id="s03">
      <ce:para id="p02">David Brenner and Eric Hall make the assumption that our statement regarding ...</ce:para>
      ...
    </ce:section>
  </ce:sections>
</body>
```

Presentation

Sir—David Brenner and Eric Hall make the assumption that our statement regarding ...

Rendering notes

Punctuation is generated. Note that the above presentation is a possible one. Instead of an em-dash a comma could be used, or the “Sir” could be typeset in small capitals.
ce:sans-serif

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:sans-serif ( %richstring.data; )*>

Description

The element ce:sans-serif is a font changing element (p. 171). It is used to obtain a sans-serif font.

Usage

XML

Here is some <ce:sans-serif>sans-serif text</ce:sans-serif>

Presentation

Here is some sans-serif text

Version history

Prior to DTD 5.0, this element was called ssf.

See also

For more information see the section on text effects (p. 171). See also ce:bold, ce:cross-out, ce:italic, ce:monospace, ce:small-caps, ce:underline.
ce:section

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:section ( ( ( ce:section-title | ( ce:label,
     ce:section-title? ) ), %parsec; ) |
     ce:section+ )>
<!ATTLIST ce:section
     id ID #IMPLIED
     role CDATA #IMPLIED
     view %view; 'all'>
```

Description

The element `ce:section` is used to create sections and subsections.

Usage

Sections and subsections are created using the element `ce:section`. Nested `ce:section` elements are used to create subsections. The nesting level determines the level of the section and hence the presentation of the section’s number (`ce:label`) and title (`ce:section-title`).

A `ce:section` must have a `ce:label` and/or a `ce:section-title`, or it should be the parent of only `ce:sections`.

The optional section number is contained within `ce:label` without closing punctuation.

```
<ce:section id="sec2">
   <ce:label>2</ce:label>
   <ce:section-title id="sect2">Asia</ce:section-title>
   <ce:section id="sec2.1">
      <ce:label>2.1</ce:label>
      <ce:section-title id="sect2.1">Japan</ce:section-title>
      <ce:para id="p12">...</ce:para>
   </ce:section>
   <ce:section id="sec2.2">
      <ce:label>2.2</ce:label>
      <ce:section-title id="sect2.2">Indonesia</ce:section-title>
      <ce:para id="p13">...</ce:para>
   </ce:section>
</ce:section>
```

Presentation

```
2. Asia
   2.1. Japan

2.2. Indonesia
```

A section which contains only `ce:sections` is invisible in the rendering. Therefore it can be used to ‘jump’ or ‘skip’ section levels. There can be no text at the skipped level, not even after the contained sections.
The attribute \textit{id} is used to cross-reference to the section.

The attribute \textit{role} allows one to categorize sections. For instance, it makes it possible to mark “Materials and Methods” sections, and handle these in different ways than ordinary sections. Applications should treat sections with roles unknown to them as ordinary sections, i.e., unknown roles must be ignored. The role must belong to a list validated by the XML validation tools. The following values for \textit{role} have been defined:

- \textit{case-report}. This role is used to identify a case report as is common in medical contexts.
- \textit{materials-methods}. This role is used to identify a materials and methods section.
- \textit{note-added-in-proof}. This role is used to identify a note added in proof section, which is added at proof stage and sometimes appears at the very end of the document.
- \textit{results}. This role is used to identify a results section.
- \textit{acknowledgement}. This role is used to mark acknowledgement-like sections, such as ‘Contributors’, ‘Conflicts of Interest’, etc.

\textbf{Explanation}

The section has become a “materials and methods” section. The presentation of such a section is style dependent; it is usually displayed in a somewhat smaller font size, but otherwise equal to an ordinary section.

Articles can appear in compact, standard and extended \textit{views}. The attribute \textit{view} is used to indicate in which views the section must appear. Its default is to appear in all views. See also the section \textit{Views} (p. 179).
Chapter 8 – The Elements of the CEP

**Version history**

Prior to DTD 5.0, this element was called `sec`.
ce:sections

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:sections ( %parsec; )>

Description

The element ce:sections is a container for sections and paragraphs (%parsec;).
ce:section-title

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:section-title ( %nondisplay.data; )*>
<!ATTLIST ce:section-title
 id ID #IMPLIED>
```

Description

The element ce:section-title is used to capture section titles.

Usage

Element ce:section-title is used to capture the (section) title of the parent element.

Version history

Prior to DTD 5.0, this element was called st.
ce:see

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:see (%text.data; )*>  
<!ATTLIST ce:see  
  refid IDREF #REQUIRED>
```

Description

Within indexes, cross-references of the “see” type are captured with the `ce:see` element.

Usage

In indexes one is often referred to another, preferred, term. This is common in subject indexes. It is done with the `ce:see` element which is a specialized version of the `ce:cross-ref` element. Note that the content of `ce:see` need not be the same as the content of the heading in the referred `ce:index-entry`.

XML

```
<ce:index-entry id="idx197">  
  <ce:index-heading>Peyrone's salt</ce:index-heading>  
  <ce:index-entry id="idx198">  
    <ce:index-heading>configuration</ce:index-heading>  
    <ce:intra-ref id="intraref246" xlink:href="pii:B008043076701001">17</ce:intra-ref>  
  </ce:index-entry>  
  <ce:index-entry id="idx199">  
    <ce:index-heading>history</ce:index-heading>  
    <ce:intra-ref id="intraref247" xlink:href="pii:B008043076701001">3</ce:intra-ref>  
  </ce:index-entry>  
</ce:index-entry>  

...

`ce:see-also`
ce:see-also

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:see-also ( %text.data; )*>
<!ATTLIST ce:see-also
  refid IDREF #REQUIRED>
```

Description

Within indexes, cross-references of the “see also” type are captured with the `ce:see-also` element.

Usage

In indexes one is often referred to another, related, term. This is common in subject indexes. It is done with the `ce:see-also` element which is a specialized version of the `ce:cross-ref` element. Note that the content of `ce:see-also` need not be the same as the content of the heading in the referred `ce:index-entry`.

**XML**

```xml
<ce:index-entry id="idx14">
  <ce:index-heading>axiomatizability</ce:index-heading>

ce:simple-para

Declaration

Model (CEPs 1.1.0–1.1.4)

```xml
<!ELEMENT ce:simple-para (%spar.data; )*>  
<!ATTLIST ce:simple-para
  id ID #IMPLIED
  role CDATA #IMPLIED
  view %view; 'all'>
```

Model (CEPs 1.1.5–1.2.0)

```xml
<!ELEMENT ce:simple-para (%spar.data; )*>  
<!ATTLIST ce:simple-para
  id ID #IMPLIED
  role CDATA #IMPLIED
  view %view; 'all'>
```

Description

The element `ce:simple-para` is used to capture paragraphs without floats.

Usage

A simple paragraph, `ce:simple-para`, belongs to the lowest-level structuring elements. It contains text and objects structured with the elements in `%spar.data;`, and differs from the full paragraph `ce:para` in that it cannot contain any floating objects, i.e. no `ce:float-anchor`.

The attribute `id` can be used to cross-reference to the paragraph.

The attribute `role` allows one to categorize simple paragraphs, and attach a special meaning to them. For instance, it makes it possible to mark a simple paragraph as a “caption”, and handle it in a different way than an ordinary paragraph. Applications should treat roles unknown to them as ordinary simple paragraphs. The role must belong to a list validated by the XML validation tools. At the time of writing, the following roles exist.

- `caption` is used to mark paragraphs of a caption that make up the caption proper and provide a description of the figure or table. It should only be used for simple paragraphs in the element `ce:caption`. Some publications distinguish the paragraphs with this `role` value from those with `role=key`, and may print them, e.g., in boldface.
- `key` is used to mark paragraphs of a caption that contain information about the keys and symbols used in the figure or table. It should only be used for simple paragraphs in the element `ce:caption`. Some publications distinguish the paragraphs with this `role` value from those with `role=caption`.
- `title` is used to mark the first paragraph of a caption (of a figure, table or textbox) as the title.

Items can appear in compact, standard and extended views. The attribute `view` is used to indicate in which views the paragraph must appear. Its default is to appear in all views. See also the section Views (p. 179).
The fact that simple paragraphs cannot contain floating objects, does not mean that they cannot contain cross-references to floating objects. For instance, if the only place where “Fig. 3” is referenced is in the caption of Fig. 2 — a simple paragraph context — then that caption contains the cross-references but the float anchor of Fig. 3 appears next to the float anchor of Fig. 2.

ce:note-para, ce:para
ce:small-caps

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT ce:small-caps ( %richstring.data; )*>

Description

The element ce:small-caps is a font changing element (p. 171). It is used to obtain small caps.

Usage

To obtain small caps, use lowercase letters within ce:small-caps. Uppercase letters in this font may or may not be identical to uppercase letters of the surrounding font.

XML
<ce:small-caps>This text is in Small Caps</ce:small-caps>.

Presentation
THIS TEXT IS IN SMALL CAPS.

Version history

Prior to DTD 5.0, this element was called scp.

For more information see the section on text effects (p. 171). See also ce:bold, ce:cross-out, ce:italic, ce:monospace, ce:sans-serif, ce:underline.
Chapter 8 – The Elements of the CEP

ce:source

Declaration

Model (CEPs 1.1.3, 1.1.4)

<!ELEMENT ce:source ( %note.data; )*> 

Model (CEP 1.1.5)

<!ELEMENT ce:source ( %note.data; )*> 

Model (CEPs 1.1.6, 1.2.0)

<!ATTLIST ce:source
    id ID #IMPLIED
    role CDATA #IMPLIED>

Description

The element ce:source is available to capture the source of an item.

Usage

The element ce:source is used to describe the source of a ce:e-component, a ce:figure, a ce:table, or a ce:textbox.

XML

<ce:textbox id="tb4-6">
  <ce:label>Box 4-6</ce:label>
  <ce:textbox-body>
    ...
  </ce:textbox-body>
</ce:textbox>

Version history

This element was added in CEP 1.1.3. In CEP 1.1.5 elements ce:anchor, ce:grant-sponsor and ce:grant-number were added to parameter entity %note.data;. The id and role attributes were added in CEP 1.1.6.
ce:stereochem

Declaration

Model (CEPs 1.1.0–1.1.5)

Model (CEPs 1.1.6, 1.2.0)

<!ATTLIST ce:stereochem
 id ID #IMPLIED
 role CDATA #IMPLIED
 view %view; 'all'>

Description

A stereochemistry abstract contains the following details of a chemical compound: structure, name, formula, and all available stereochemical information. For each important chemical compound mentioned in a document, the element ce:stereochem provides a way to capture it.

Usage

The element ce:stereochem contains four subelements, corresponding to each of the parts of a stereochemistry abstract.

The first is ce:compound-struct, which contains a ce:link to a picture showing the chemical structure. The second is the optional ce:compound-name, which contains the compound’s name. The third is the optional ce:compound-formula, giving the formula. At least one of these latter two elements should be present. The fourth is ce:compound-info, containing one or more ce:list-item elements with additional stereochemical information.

XML

<ce:stereochem id="sc1">
  <ce:compound-struct><ce:link locator="fx7"/></ce:compound-struct>
  <ce:compound-name><ce:italic>§S</ce:italic>-2-<ce:italic>⌣</ce:italic>-Butyldimethylsilylpent-4-enal</ce:compound-name>
  <ce:compound-formula><ce:inf>12</ce:inf>H<ce:inf>22</ce:inf>OSi</ce:compound-formula>
  <ce:compound-info>
    <ce:list-item id="li1">
      <ce:para>E.e. &ge; 95%</ce:para>
    </ce:list-item>
    <ce:list-item id="li2">
      <ce:para>E.e. &ge; 95%</ce:para>
    </ce:list-item>
  </ce:compound-info>
</ce:stereochem>
Source of chirality: Sharpless AE

Absolute configuration:

E.e. \( \geq 95\% \)

Rendering notes

The stereochemistry abstracts, whose nature is much like keywords, are part of the front-matter, even though they may appear elsewhere in the paper publication. For online applications, the intended usage is to collect the stereochemistry abstracts (e.g., per publication) from the articles and to display them together.

Version history

The id, role and view attributes were added in CEP 1.1.6.
ce:subtitle

Declaration

Model (CEPs 1.1.0–1.1.6)

```xml
<!ELEMENT ce:subtitle ( %textfn.data; )*>
```

Model (CEP 1.2.0)

```xml
<!ELEMENT ce:subtitle ( %textfn.data; )*>
<!ATTLIST ce:subtitle id ID #IMPLIED>
```

Description

The element `ce:subtitle` contains the subtitle of an article, chapter, or other item.

Usage

The element `ce:subtitle` is used to capture the subtitle of an item, e.g. a journal article or book chapter. Parts of the title that form an integral part of the title, e.g. separated from the first part by a colon or an em-dash, are not subtitles. Tables of content tend not to contain subtitles.

```xml
<ce:title id="t1">The monadic second-order logic of graphs, Part IX: Hierarchical decompositions of directed graphs</ce:title>
```

Explanation

Here it is not appropriate to make a division in title and subtitle, because the name of part IX is an integral part of the title.

```xml
<ce:title id="t1">Hierarchical decompositions of directed graphs</ce:title>
<ce:subtitle>Part IX in a series of papers devoted to monadic second-order logic of graphs</ce:subtitle>
```

Version history

In DTDs prior to DTD 5.0, the element `sbt` fulfilled the function of both `ce:subtitle` and `ce:alt-subtitle`; the language was specified in the parent `atl` element. Attribute `id` was added in CEP 1.2.0.

See also

`ce:alt-title, ce:alt-subtitle, ce:title`
**ce:suffix**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```
<!ELEMENT ce:suffix ( %richstring.data; )*>
```

**Description**

A suffix of the author name, e.g. junior or senior, is captured using `ce:suffix`.

**Usage**

A name suffix, mostly denoting a generation, such as “Junior” or “Senior”, is tagged with `ce:suffix`.

**XML**

```
<ce:given-name>Sammy</ce:given-name>
<ce:surname>Davis</ce:surname>
<ce:suffix>Sr.</ce:suffix>
```

```
<ce:given-name>Henry</ce:given-name>
<ce:surname>Ford</ce:surname>
<ce:suffix>III</ce:suffix>
```

**Version history**

In DTDs prior to DTD 5.0, this element was called `jr`.

**See also**

`ce:author`, `ce:degrees`, `ce:given-name`, `ce:roles`, `ce:surname`
ce:sup

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:sup (%richstring.data;)*>
<!ATTLIST ce:sup
  loc %loc; "post">
```

Description

Superscripts are captured using `ce:sup`.

Usage

Superscripts (superior text) are captured using `ce:sup`.

The optional attribute `loc` can have the values `pre` and `post`, the latter is equivalent to omitting the attribute altogether. If `loc` is equal to `pre` this is to signify that the element belongs to the subsequent object.

XML

```xml
<ce:sup loc="pre">238</ce:sup><ce:inf loc="pre">92</ce:inf>U
```

Presentation

\[ 238^92\]

By default, a super- and subscript appearing at one object will be displayed stacked, i.e. above each other. Staggered super- and subscripts (for example, \( R_{ij}^k \)) can only be used in math mode.

See also

`ce:inf`
ce:surname

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:surname ( %text.data; )*>

Description

The surname of an author or editor is captured using ce:surname.

Usage

Together with the element ce:given-name, ce:surname forms the name of authors or editors.

XML
<ce:given-name>Franklin D.</ce:given-name>
<ce:surname>Roosevelt</ce:surname>

Especially for non-Western persons, it is not always clear or known what the given name and the surname is. In some regions of the world, it is even not uncommon to have just one name. In such cases, ce:surname may contain the full name of the person.

XML
<ce:author>
<ce:surname>Ho Chi Minh</ce:surname>
</ce:author>

If the author or editor (especially of a work in the bibliographic reference list) is not a person but an institution or corporation, the name is also tagged using ce:surname. (This should not be confused with a collaboration, ce:collaboration.)

XML
<ce:surname>National Board of Safety</ce:surname>

  xmlns:tb CDATA #FIXED %ESTB.xmlns;>
```

Model (CEPs 1.1.3–1.1.5)

```xml
<!ATTLIST ce:table
  frame ( top|bottom|topbot|all|sides|none ) #IMPLIED
  colsep %yesorno; #IMPLIED
  rowsep %yesorno; #IMPLIED
  id ID #IMPLIED
  xmlns CDATA #FIXED %CALS.xmlns;
  xmlns:tb CDATA #FIXED %ESTB.xmlns;>
```

Model (CEP 1.1.6)

```xml
<!ATTLIST ce:table
  frame ( top|bottom|topbot|all|sides|none ) #IMPLIED
  colsep %yesorno; #IMPLIED
  rowsep %yesorno; #IMPLIED
  id ID #IMPLIED
```

Elsevier Documentation for the XML DTD 5 Family 405
A table is captured with \textit{ce:table}.

**Usage**

Aligning text in rows and columns is done using tables. The element \textit{ce:table} is used to capture a table. Two kinds of tables are distinguished: displayed tables and floating tables.

Displayed tables are contained within the container element \textit{ce:display}. They appear, surrounded by some white space, where they are mentioned in the text.

Floating tables are grouped, together with the other floating objects such as figures, in a \textit{ce:floats} container at the beginning of the document. Floating tables must be referred to from within the text using a \textit{ce:cross-ref} or a \textit{ce:cross-refs} and a \textit{ce:float-anchor} is used to indicated the position near to which the floating table must appear. So, each floating table is referenced by at least one cross-reference and exactly one float anchor.

\textit{XML}

\begin{verbatim}
see <ce:cross-refs refid="tbl1 tbl2 tbl3">Tables
1&ndash;3</ce:cross-ref><ce:float-anchor refid="tbl1"/>
<ce:float-anchor refid="tbl2"/>&lt;&lt;ce:float-anchor refid="tbl3"/>
\end{verbatim}

A table begins with a \textit{ce:label} (mandatory for floating tables) and an optional \textit{ce:caption} with a description of the table. There can be multiple captions for different languages and/or roles; each caption must have a different role or language. The optional \textit{ce:source} element is used to describe the source of the table. The optional \textit{ce:copyright} element is used if the copyright owner of the table differs from the copyright owner of the document.

The optional \textit{ce:keywords} subelements are used to capture keywords for the table. They can be different from the keywords of the item. Normally these are not rendered but are used to improve searching and annotation. The same constraints as for the item keywords apply (e.g., allowed class values, nesting).

The actual table is contained in \textit{tgroup} elements, and/or is delivered as images, \textit{ce:link}. The \textit{tgroup} contains an extended CALS table, described in more detail in Chapter 12.

Below the tabular content the legend, \textit{ce:legend}, and table footnotes, \textit{ce:table-footnote}, are found.
Version history

The subelement `ce:copyright` was introduced in CEP 1.1.2. At the same time, the caption was made repeatable. Subelement `ce:source` was introduced in CEP 1.1.3, while `ce:keywords` was added in CEP 1.2.0.

See also

For more information, see Chapter 12.
Chapter 8 – The Elements of the CEP

ce:table-footnote

Declaration

Model (CEPs 1.1.0–1.1.5)

<!ELEMENT ce:table-footnote ( ce:label, ce:note-para+ )>
<!ATTLIST ce:table-footnote
       id ID #REQUIRED>

Model (CEPs 1.1.6, 1.2.0)

<!ELEMENT ce:table-footnote ( ce:label, ce:note-para+ )>
<!ATTLIST ce:table-footnote
       id ID #REQUIRED
       role CDATA #IMPLIED>

Description

A table footnote is a footnote referenced and displayed within a table, and coded with ce:table-footnote.

Usage

The element ce:table-footnote occurs zero or more times at the end of ce:table, after the optional ce:legend and contains the table footnotes.

The first subelement of ce:table-footnote is a mandatory ce:label element. It contains the symbol of the table footnote with implied presentation style, i.e., if the style of the footnote symbol is a superior letter, the ce:label contains only the letter.

The text of the table footnote is contained in one or more note paragraphs, ce:note-para.

There must always be a cross-reference to a table footnote. Note that it is not allowed to cross-reference to a table footnote from outside the table in which the table footnote appears.

A table footnote should not be confused with a ce:legend.

Version History

The role attribute was added in CEP 1.1.6.
ce:text

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:text ( %text.data; )*>
<!ATTLIST ce:text
id ID #IMPLIED>
```

Description

The element `ce:text` is a container element for text.

Usage

Various elements contain `ce:text` as a general container for text with content model `%text.data;`. The exact content of `%text.data;` is described in the section on Parameter entities (p. 174).

See also

`ce:textfn, ce:textref`
ce:textbox

Declaration

Model (CEPs 1.1.0–1.1.1)

```xml
<!ELEMENT ce:textbox ( ce:label?, ce:caption?, ce:copyright?,
            ce:textbox-head?, ce:textbox-body,
            ce:textbox-tail? )>
<!ATTLIST ce:textbox
    id ID #IMPLIED
    role CDATA #IMPLIED>
```

Model (CEP 1.1.2)

```xml
<!ELEMENT ce:textbox ( ce:label?, ce:caption*, ( %copyright; )?, ce:textbox-head?,
            ce:textbox-body, ce:textbox-tail? )>
<!ATTLIST ce:textbox
    id ID #IMPLIED
    role CDATA #IMPLIED>
```

Model (CEPs 1.1.3–1.1.6)

```xml
<!ELEMENT ce:textbox ( ce:label?, ce:caption*, ce:source?,
            ( %copyright; )?, ce:textbox-head?,
            ce:textbox-body, ce:textbox-tail? )>
<!ATTLIST ce:textbox
    id ID #IMPLIED
    role CDATA #IMPLIED>
```

Model (CEP 1.2.0)

```xml
<!ELEMENT ce:textbox ( ce:label?, ce:caption*, ce:source?,
            ( %copyright; )?, ce:keywords*,
            ce:textbox-head?, ce:textbox-body,
            ce:textbox-tail? )>
<!ATTLIST ce:textbox
    id ID #IMPLIED
    role CDATA #IMPLIED>
```

Description

A textbox (in this context written as one word) is an object similar to a figure, but rather
than a graphic it contains typeset material, which could be regarded as a small document in
its own right, sometimes displayed with a coloured background. The element `ce:textbox`
is provided for this purpose.

Usage

The element `ce:textbox` can be used in a variety of ways. Similar to `ce:figure` it is
embedded within `ce:display` or `ce:floats`. A displayed textbox appears in the text
at the position where it is used, separated from the surrounding text with white space. A
floating textbox, collected among the floats in `ce:floats` appears in the text near the point
where a `ce:float-anchor`, pointing to the textbox, is placed.

The name of the textbox, e.g. “Box II”, is contained in the subelement `ce:label`. The
`ce:caption` contains one or more paragraphs, `ce:compound-para`, of descriptive text. There
can be multiple captions, for different languages and/or roles; each caption must have a different role or language.

The optional subelement `ce:source` is used to describe the source of the figure. The optional subelement `ce:copyright` can be used if the copyright of the textbox differs from the copyright of the document in which it is embedded.

The optional `ce:keywords` subelements are used to capture keywords for the textbox. They can be different from the keywords of the item. Normally these are not rendered but are used to improve searching and annotation. The same constraints as for the item keywords apply (e.g., allowed class values, nesting).

A `ce:textbox` has an `id` attribute, so that it can be (but does not have to be) referred to using `ce:cross-ref` or `ce:cross-refs` (or from a foreign document). A floating textbox must have exactly one `ce:float-anchor` referring to it.

The structure of a textbox is an optional head (`ce:textbox-head`), a body (`ce:textbox-body`) and an optional tail (`ce:textbox-tail`). Simple textboxes will typically only have a body, but more elaborate textboxes with their own author names and bibliographic references exist also. Since the variety in textboxes is large, it contains many optional subelements.

The head, `ce:textbox-head`, begins with a titles sequence containing a title, `ce:title` and a subtitle, `ce:subtitle`, followed by possible combinations of titles and subtitles in an alternative language (`ce:alt-title`, `ce:alt-subtitle`). A sequence of author groups, `ce:author-group`, and an introductory section, `ce:intro`, complete the head.

The body of a textbox may contain paragraphs and sections within a `ce:sections` container and an acknowledgment (`ce:acknowledgment`), and ends with `ce:appendices`.

The tail of a textbox may contain a bibliography (`ce:bibliography`), a further-reading section (`ce:further-reading`), a glossary (`ce:glossary`), and biographies of the authors (`ce:biography`).

Note that an elaborate textbox itself resembles a small article. It may well contain its own figures and tables.

At the time of writing, the following value for `ce:textbox`’s attribute `role` is defined: `pull-quote`. This is used to capture pull quotes, i.e., sentence or phrase excerpted from the main text, often set in large type, used to break up running text and draw the reader’s attention.

**Version history**

Prior to DTD 5.0, elaborate textboxes were separate SGML instances, declared as SUBDOC in the main file. Such textboxes were called linked textboxes.

As from CEP 1.1.2, the caption is repeatable. Parameter entity `%copyright;` was introduced as well. Subelement `ce:source` was introduced in CEP 1.1.3, while `ce:keywords` was added in CEP 1.2.0.

**Light reading**

No floating textboxes may be used in CONTENTS-ENTRY-ONLY, HEAD-ONLY or HEAD-AND-TAIL files.

ce:textbox-body

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT ce:textbox-body ( ce:sections, ce:acknowledgment?, ce:appendices? )>

Description

The element *ce:textbox-body* contains the body of a textbox, with a number of sections, an acknowledgment and appendices.

Usage

See *ce:textbox*. 
ce:textbox-head

Declaration

Model (CEPs 1.1.0–1.2.0)

```
```

Description

The element `ce:textbox-head` contains the head of a textbox. It may contain titles and author names, and an introduction.

Usage

See `ce:textbox`. 
ce:textbox-tail

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:textbox-tail ( ce:bibliography?, ce:further-reading?,
                          ce:glossary?, ce:biography* )>

Description

The element ce:Textbox-tail contains the tail of a textbox, with a bibliography, a further-reading section, a glossary and biographies.

Usage

See ce:Textbox.

Version history

Optional subelements ce:glossary and ce:biography were introduced in CEP 1.1.1.
ce:textfn

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT ce:textfn ( %textfn.data; )*>
<!ATTLIST ce:textfn
  id ID #IMPLIED>

Description

The element ce:textfn is a container element for text.

Usage

Various elements contain ce:textfn as a general container for text with content model %textfn.data;. The exact content of %textfn.data; is described in the section on Parameter entities (p. 174).

See also

ce:text, ce:textref
ce:textref

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:textref (%textref.data; )*>
<!ATTLIST ce:textref id ID #IMPLIED>
```

Description

The element `ce:textref` is a container element for text.

Usage

Various elements contain `ce:textref` as a general container for text with content model `%textref.data;`. The exact content of `%textref.data;` is described in the section on Parameter entities (p. 174).

Declaration

Model (CEPs 1.1.0–1.1.6)

<!ELEMENT ce:title ( %textfn.data; )*>

Model (CEP 1.2.0)

<!ELEMENT ce:title ( %textfn.data; )*>
<!ATTLIST ce:title id ID #IMPLIED>

Description

The element ce:title contains the title of an article, chapter, or other item.

Usage

The element ce:title is used to capture the title of an item, e.g. a journal article or book chapter.

XML

<ce:title id="t1">Tag by Tag</ce:title>

Version history

In DTDs prior to DTD 5.0, the element atl fulfilled the function of both ce:title and ce:alt-title; moreover, it contained the subtitle within it. Attribute id was added in CEP 1.2.0.

See also

ce:alt-title, ce:alt-subtitle, ce:subtitle
ce:underline

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:underline ( %richstring.data; )*>
```

Description

The element ce:underline is related to the font changing elements (p. 171). It is used to obtain underlined text.

Usage

To obtain underlined text, use ce:underline.

XML

```xml
<ce:underline>This text is underlined</ce:underline>.
```

Presentation

This text is underlined.

See also

For more information see the section on text effects (p. 171). See also ce:bold, ce:cross-out, ce:italic, ce:monospace, ce:sans-serif.
ce:vsp

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT ce:vsp EMPTY>
<!ATTLIST ce:vsp
    sp NMTOKEN "1.0">
```

Description

The element `ce:vsp` is used to create explicit vertical space.

Usage

If the need arises to indicate explicit vertical spacing, `ce:vsp` can be used. It has one attribute, `sp`, which determines the amount of vertical space to be inserted, measured as a multiple of the baseline-to-baseline distance, default \(1.0\). It is a non-negative floating number.

If `<ce:vsp sp="1.5">` occurs in the running text, this should be displayed as follows: move down by 1.5 “baseline skip” and do not start a new line. However, if it is immediately followed by a `<ce:para>`, `<ce:note-para>` or `<ce:simple-para>` tag, the next paragraph is not indented.

```
XML
  Text1<ce:vsp/>Text2
Presentation
  Text1
  Text2
```

```
XML
  Text1<ce:vsp sp="2.0"/><ce:para>Text2
Presentation
  Text1
    Text2
```

```
XML
  Text1<ce:para><ce:vsp sp="2.0"/>Text2
Presentation
  Text1
    Text2
```

It is not allowed to use `ce:vsp` for creating built-up structures.
This chapter contains a listing of the DTD fragment for structured affiliations. This fragment also belongs to the common element pool (CEP 1.2), but its elements have been assigned to a separate namespace, http://www.elsevier.com/xml/common/struct-aff.dtd.

**sa:affiliation**

Model (CEP 1.2.0)

```xml
<!ATTLIST sa:affiliation xmlns:sa CDATA #FIXED %ESSA.xmlns;>
```

The main element is `sa:affiliation`. It contains the affiliation of an author or collaboration (`ce:affiliation/ce:textfn`), broken down into parts. The element may not have empty content even though all its subelements are optional.

**sa:organization**

Model (CEP 1.2.0)

```xml
<!ELEMENT sa:organization ( %richstring.data; )>>
```

`sa:organization` contains the name of the organization that is part of the affiliation. It can appear multiple times.

**sa:address-line**

Model (CEP 1.2.0)

```xml
<!ELEMENT sa:address-line ( %text.data; )>>
```

The `sa:address-line` elements contain the address parts of an affiliation, a city district, a street, P.O. Box, etc.

**sa:city**

Model (CEP 1.2.0)

```xml
<!ELEMENT sa:city ( %text.data; )>>
```

Within the affiliation, the city name is contained within `sa:city`. The word "city" is used here in a "postal" sense, in that it can also mean a village, an air force base, a ship, etc.

**sa:state**

Elsevier Documentation for the XML DTD 5 Family

421
Chapter 9 – Structured affiliations

Model (CEP 1.2.0)
<!ELEMENT sa:state ( %text.data; )*>

sa:state contains the state name within an affiliation. This can be an American state, but also a Canadian province, an English county, etc.

Model (CEP 1.2.0)
<!ELEMENT sa:postal-code ( %string.data; )*>

sa:postal-code contains the postal code of the address. To find out where the postal code must be displayed with respect to city and/or country other sources must be consulted.

Model (CEP 1.2.0)
<!ELEMENT sa:country ( %text.data; )*>

Within the affiliation, the country name is contained within sa:country.

XML

Chapter 10

Structured bibliographic references

This chapter contains an alphabetic listing of the DTD fragment for structured bibliographic references. This fragment also belongs to the common element pool (CEP 1.2), but its elements have been assigned to a separate namespace. This makes it possible, for instance, that the structure of an author name in a bibliographic reference differs from that in the head of an article: The elements `ce:author` and `sb:author` both exist.

The first section of this chapter contains extensive examples of various types of references and their XML coding. It is followed by detailed descriptions of each of the elements.
Bibliographic references — Examples

The fragment of the DTD related to bibliographic references is quite extensive. In this section, structured references are illustrated in the form of examples. The rendering given in the examples does not necessarily follow one of the standard presentations for bibliographic references.

The top-level element for a structured bibliographic reference is `sb:reference`. It uses concepts of “contributions” that appear in one or more “hosts”. Four types of hosts exist: issue, book, edited book and electronic host.

**Examples of structured references**

The examples in this section are ordered by the type of host.

1. `sb:issue` as `sb:host`
2. `sb:book` as `sb:host`
3. `sb:edited-book` as `sb:host`
4. `sb:e-host` as `sb:host`, and other hosts on the web

Some examples demonstrate additional features.

- Non-English journal article, with an English `sb:translated-title` (Example 4)
- Book originally published in another language, with a translator (Example 7)
- Multiple hosts (Example 9, Example 14, Example 16)
- `sb:book-series` element (Example 12, Example 13)
- A book series published over a period of several years (Example 13)
- Publications on the web other than preprints (Example 15)
- `sb:comment` element (Example 3, Example 7, Example 16)
- `ce:note` element (Example 16)

1. **`sb:issue` as `sb:host`**

   1. Simple journal article, two authors et al., paginated by issue.

   **Presentation**
   

   **XML**
   
   `<ce:bib-reference id="ref1"/>
   <ce:label>[1]</ce:label>
   <sb:reference id="sbr01">
     <sb:contribution>
       <sb:authors>
         <sb:author>
           <ce:given-name>A.</ce:given-name>
           <ce:surname>Paivio</ce:surname>
         </sb:author>
         <sb:author>
           <ce:given-name>L.J.</ce:given-name>
           <ce:surname>Becker</ce:surname>
         </sb:author>
       </sb:authors>
     </sb:contribution>
   </sb:reference>`
2. An article in a journal supplement, only first page given. The fact that it is a supplement can in this example be seen from the \texttt{sb:issue-nr}. Otherwise, there is no difference with an article in a normal issue.

\textit{Presentation}

\textit{XML}

<ce:bib-reference id="ref2">
  <sb:reference id="sbr02">
    <sb:contribution>
      <sb:authors>
        <sb:author>
          <ce:given-name>S.</ce:given-name>
          <ce:surname>Koczkas</ce:surname>
        </sb:author>
        <sb:author>
          <ce:given-name>G.</ce:given-name>
          <ce:surname>Holmberg</ce:surname>
        </sb:author>
        <sb:author>
          <ce:given-name>L.</ce:given-name>
          <ce:surname>Wedin</ce:surname>
        </sb:author>
      </sb:authors>
      <sb:title>
        Comparisons through the mind's eye
      </sb:title>
      <sb:host>
        <sb:series>
          <sb:title>Cognition</sb:title>
        </sb:series>
      </sb:host>
    </sb:reference>
  </ce:label>
</ce:bib-reference>
3. Entire issue of a journal. In addition to the \texttt{sb:title} in the \texttt{sb:series} (the journal title), the issue of this example has a title and (guest) editors of its own. The additional text '(special issue)' is tagged as a comment.

This example is typical for special issues.

\textit{Presentation}

\textit{XML}

\begin{verbatim}
<ce:bib-reference id="ref3">
<ce:label>[3]</ce:label>
<sb:reference id="sbr03">

        <sb:host>
            <sb:book>
                <sb:title>
                    <sb:maintitle>College bound seniors</sb:maintitle>
                </sb:title>
            </sb:book>
        </sb:host>
    </sb:reference>
</ce:bib-reference>
```
Chapter 10 – Structured bibliographic references

Bibliographic references — Examples

7. Book originally published in another language, with a translator.\(^3\) In this example the original title and the original language are not given.

Presentation

XML

```xml
<ce:bib-reference id="ref7">
  <ce:label>[7]</ce:label>
  <sb:reference id="sbr07">
    <sb:contribution>
      <sb:authors>
        <sb:author>
          <ce:given-name>A.R.</ce:given-name>
          <ce:surname>Luria</ce:surname>
        </sb:author>
      </sb:authors>
      <sb:title>
        <sb:maintitle>The mind of a mnemonist</sb:maintitle>
      </sb:title>
      <sb:comment>(L. Solotarof, Trans.)</sb:comment>
    </sb:contribution>
    <sb:host>
      <sb:book>
        <sb:date>1969</sb:date>
        <sb:publisher>
          <sb:name>Avon books</sb:name>
          <sb:location>New York</sb:location>
        </sb:publisher>
      </sb:book>
      <sb:comment>(Original work published 1965)</sb:comment>
    </sb:host>
  </sb:reference>
</ce:bib-reference>
```

3. \(sb:\text{edited-book}\) as \(sb:\text{host}\)

An \(sb:\text{edited-book}\) contains at least an \(sb:\text{date}\). When the \(sb:\text{host}\) is an \(sb:\text{edited-book}\), the \(sb:\text{contribution}\) usually is an article or a chapter in that book. In that case there is an \(sb:\text{title}\) in both the \(sb:\text{contribution}\) and the \(sb:\text{host}\), much like an article in an \(sb:\text{issue}\).

8. Article or chapter in edited book.

\(^3\) There is no separate element for translator.

            <sb:volume-nr>Vol. 1</sb:volume-nr>
          </sb:series>
        </sb:book-series>
        <sb:date>1977</sb:date>
        <sb:publisher>
          <sb:name>Plenum Press</sb:name>
          <sb:location>New York</sb:location>
        </sb:publisher>
      </sb:edited-book>
    </sb:host>
  </sb:reference>
</ce:bib-reference>

13. A multi-volume edited work, publication over more than one year. In this example the whole series is cited; therefore the \texttt{sb:contribution} element is absent, and the \texttt{sb:edited-book} contains only elements that belong to the series: \texttt{sb:book-series}, \texttt{sb:dates} and \texttt{sb:publisher}. The fact that the series was published over a period of several years, is expressed by the presence of multiple \texttt{sb:dates}.

Presentation

XML
4. **sb:e-host as sb:host, and other hosts on the web**

An **sb:e-host** cannot at the same time be an **sb:issue**, **sb:book** or **sb:edited-book**. Therefore it is mainly used for articles on the web that do not belong to any of the other types of host, mostly for preprints. However, one of the examples below shows how a book can have an **sb:e-host** as one of its hosts.

14. An electronic host, **sb:e-host**, consists of a **ce:inter-ref** element and an optional **sb:date**. Formally, the **ce:inter-ref** is optional too, but in practice it is not.

In this example the **sb:e-host** contains the preprint, and the **sb:issue** contains the printed article. It also often occurs that the **sb:e-host** is the only host.

**Presentation**

**XML**

```xml
<ce:bib-reference id="ref14">
<ce:label>[14]</ce:label>
<sb:reference id="sbr14">
<sb:contribution>
<sb:authors>
<ce:given-name>J.G.</ce:given-name>
<ce:surname>Wilson</ce:surname>
</sb:author>
<ce:given-name>F.C.</ce:given-name>
<ce:surname>Fraser</ce:surname>
</sb:editors>
</sb:series>
</sb:issue>
</sb:reference>
</ce:bib-reference>
```
15. Article in proceedings, published on the web. In this example the host is a proceedings, hence an `sb:edited-book`, even though it is published solely on the web (or that is the only publication given). The `sb:title` of the `sb:contribution` contains a `ce:inter-ref` element with a leading to a file for this specific article. In addition, the URL of the proceedings is tagged as an `ce:inter-ref` element in the `sb:title` of the `sb:host`.

**Presentation**

**XML**

```xml
<ce:bib-reference id="ref15" />
<ce:label>[15]</ce:label>
<sb:reference id="sbr15">
  <sb:contribution>
    <sb:authors>
      <sb:author>
        <ce:given-name>F.</ce:given-name>
        <ce:surname>Douglis</ce:surname>
      </sb:author>
      <sb:author>
        <ce:given-name>Th.</ce:given-name>
        <ce:surname>Ball</ce:surname>
      </sb:author>
    </sb:authors>
  </sb:contribution>
</sb:reference>
```
16. Article with maximum usage of comments: an `<sb:comment>` before the `<sb:contribution>`, an `<sb:comment>` before each of the `<sb:host>`s, and an `<sb:comment>` after the last `<sb:host>`. It also has a `<ce:note>`.

**Presentation**

This reference discusses the basic concepts in a very thorough manner. Its literature list is a main entry point into the discipline.

**XML**

sb:author

Declaration

Model (CEPs 1.1.0–1.1.6)
<!ELEMENT sb:author ( %name; )>

Model (CEP 1.2.0)
<!ELEMENT sb:author ( %name; )>
<!ATTLIST sb:author orcid CDATA #IMPLIED>

Description

Within structured bibliographic references, author names are tagged using sb:author.

Usage

The element sb:author has %name; as its content model. That means that it contains a ce:surname and optionally a ce:given-name in any order, possibly followed by a ce:suffix and one or more ce:alt-names. For more details, see those elements.

Attribute orcid contains a unique identification of the author coming from a global author database: the ORCID (Open Research & Contributor ID).

XML
<sb:author>
  <ce:given-name>D.E.</ce:given-name>
  <ce:surname>Knuth</ce:surname>
</sb:author>

XML
<sb:author>
  <ce:surname>Liszt</ce:surname>
  <ce:given-name>Ferenc</ce:given-name>
</sb:author>

XML
<sb:author>
  <ce:surname>National Institute of Health</ce:surname>
</sb:author>

Version history

In CEP 1.2.0 the attribute orcid was added, while element ce:alt-name was added to parameter entity %name;.

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:authors

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT sb:authors ( ( sb:collaboration | ( sb:author,
sb:et-al? ) )+ )>
```

Description

Within structured bibliographic references, `sb:authors` is a container element for the authors of the reference.

Usage

The element `sb:authors` consists of a non-empty sequence of collaborations (`sb:collaboration`) and authors (`sb:author`) possibly followed by an `sb:et-al` element. For more information, see these elements.

```xml
<sb:authors>
  <sb:author>
    <ce:given-name>D.C.</ce:given-name>
    <ce:surname>Coleman</ce:surname>
  </sb:author>
  <sb:et-al/>
</sb:authors>
```

**sb:book**

**Declaration**

**Model (CEPs 1.1.0–1.1.6)**

```xml
<!ELEMENT sb:book ( ( %sb.titles; )?, sb:edition?,
sb:book-series?, sb:date+,
sb:publisher?, sb:isbn? )>
```

**Model (CEP 1.2.0)**

```xml
<!ELEMENT sb:book ( ( %sb.titles; )?, sb:edition?,
sb:book-series?, sb:date+,
sb:publisher?, sb:isbn? )>
```

```xml
<!ATTLIST sb:book
class CDATA #IMPLIED>
```

**Description**

Within bibliographic references, the structure of a book is captured using `sb:book`.

**Usage**

One of the four types of “hosts” is `sb:book`, used when structuring references to (non-edited) books.

Such simple books, or monographs, are considered as a single “contribution” occurring in the host. Consequently, the author names and the title of the work can in virtually all cases be found in the `sb:contribution`. The optional titles within the `sb:book` are used when no author is given. An average book, therefore, only contains the following subelements.

The optional subelement `sb:edition` contains information about the edition of the book. The date of publication of the book — or, more accurately, the host, for a book may well appear in different hosts — is captured using `sb:date`. A book can have more than one date. The name and place of the publisher are contained within `sb:publisher`. Finally, the element `sb:isbn` can be used to capture the ISBN number of the referenced book, if required.

**XML**

```xml
<sb:contribution>
<sb:authors>
<sb:author>
<ce:given-name>B.M.</ce:given-name>
<ce:surname>Travis</ce:surname>
</sb:author>
<sb:author>
<ce:given-name>D.</ce:given-name>
<ce:surname>Waldt</ce:surname>
</sb:author>
</sb:authors>
<sb:title>
<sb:maintitle>The SGML Implementation Guide</sb:maintitle>
<sb:subtitle>A Blueprint for SGML Migration</sb:subtitle>
</sb:title>
```

    <sb:author>E. Chabanat</sb:author>
    <sb:location>Bellevue, WA</sb:location>
  </sb:book>
</sb:host>

Presentation

Quick Course in Microsoft® Powerpoint® 97 (Online Press Inc., Bellevue, WA, 1997).

Explanation

This book has no mention of authors or editors. The title within the sb:book is used.

Reports, Ph.D. theses and the like often contain the same components as a book. These references should be captured with sb:book. To distinguish them from books and to be able to treat them differently the class attribute should be used with value report. Thus far this is the only defined value for class.

XML

<sb:contribution>
  <sb:authors>
    <sb:author>E. Chabanat</sb:author>
  </sb:authors>
  <sb:title>Interactions effectives pour des conditions extremes d'isospin</sb:title>
</sb:contribution>

<sb:comment>PhD. thesis</sb:comment>

XML

Version history

The parameter entity %sb.titles; was introduced in CEP 1.1.0. Attribute class was added in CEP 1.2.0.

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:book-series

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT sb:book-series ( sb:editors?, sb:series )>

Description

Within bibliographic references, the name of a book series and the volume number of the work within that series are captured using sb:book-series.

Usage

XML

```
<sb:book-series>
  <sb:series>
    <sb:title>
      <sb:maintitle>Lecture Notes in Mathematics</sb:maintitle>
    </sb:title>
    <sb:volume-nr>Vol. 1201</sb:volume-nr>
  </sb:series>
</sb:book-series>
```

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:collaboration

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT sb:collaboration ( %text.data; )*>  

Description

Within structured bibliographic references, the name of a collaboration is tagged using sb:collaboration.

Usage

A collaboration denotes a group of authors who present themselves under a common name: the collaboration name. In a structured bibliographic reference, it can appear at the same place as where an sb:author can appear.

If the author is not a person but a government body or another organization, then this is not a collaboration.

See also

sb:author, ce:collaboration. Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:comment

Declaration

Model (CEPs 1.1.0–1.2.0)

<%ELEMENT sb:comment ( %nondisplay.data; )%>

Description

Comments within structured bibliographic references are captured using sb:comment.

Usage

The element sb:comment is used to insert text between the highly structured bibliographic references.

The element sb:comment can occur before the contribution, between the contribution and the host, and after each host. It holds text which, when rendered, can appear between the highly structured contribution and hosts. Whether the sb:comment belongs to the host or contribution before or after it cannot be signified.

sb:comment should not be confused with ce:note.

XML

<bib-reference id="bib49">
  <ce:label>[49]</ce:label>
  <sb:reference id="sbref056">
    <sb:comment>See the references in</sb:comment>
    <sb:contribution>...</sb:contribution>
    <sb:comment>first published in</sb:comment>
    <sb:host>...</sb:host>
    <sb:comment>also available electronically as</sb:comment>
    <sb:host>...</sb:host>
    <sb:comment>(in Japanese)</sb:comment>
  </sb:reference>
</bib-reference>

Version history

In CEP 1.1.1 the content model was changed to allow for more content (elements ce:footnote and ce:anchor).

See also

ce:note. Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:conference

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT sb:conference (%text.data; )*>  

Description

Within bibliographic references, it may happen that conference information (such as the location or the date) is present for the proceedings of a conference, appearing as an sb:issue or an sb:edited-book. This information, seldom present in actual bibliographic references, can be captured using sb:conference.

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:contribution

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT sb:contribution ( sb:authors?, ( %sb.titles; )? )>
<!ATTLIST sb:contribution
  langtype %language-type; "en" xml:lang %iso639; #IMPLIED>
```

Description

Each structured bibliographic reference is divided into an “sb:contribution” and one or more “sb:host”s.

Usage

Bibliographic references are structurally split into a “contribution” and one or more “hosts”. Contribution is the abstract term used for the referenced object separated from its physical appearance. An sb:contribution can be a scientific article or book, but also a map, audiotape, Internet page, etc.—any object referred to in a reference list. Some examples: In a reference to an article in a journal issue or in an edited volume, the sb:contribution contains the author names and title of the article. A monograph (simple book) is seen as one contribution within a host.

It is possible to specify the language of the contribution using the attributes langtype and xml:lang, which takes its values in %iso639; i.e., the ISO 639 list of language codes (p. 178). The language type (%language-type;) gives an indication about the language in which the contribution is written. It can take the following values: en (English); non-en (an unspecified non-English language); iso (a language specified in the xml:lang attribute). The value unknown is used when the reference gives no indication whatsoever about the language.

The attribute xml:lang is mandatory when langtype has the value iso and may not be present for other values of langtype.

A contribution consists of an optional author group (sb:authors), and optional title and/or translated title.

Version history

The parameter entity %sb.titles; was introduced in CEP 1.1.0.

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:date

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT sb:date ( %richstring.data; )*>

Description

Within structured bibliographic references, dates of publication are tagged using sb:date.

Usage

The element sb:date contains the date of publication of a structured bibliographic reference. This may contain merely a year or a full date, depending on the author’s manuscript. For books or edited books multiple dates can be given — these must be captured in different sb:date elements.

XML
<sb:date>1999</sb:date>
XML
<sb:date>12 December 1999</sb:date>
XML
<sb:date>1975</sb:date><sb:date>1997</sb:date>

In name/date references, references that share the same author names and year are listed as “(Böhm, 1999a)”. The “a” is not part of the sb:date; it is found in the ce:label subelement of ce:bib-reference, q.v.

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:edited-book

Declaration

Model (CEPs 1.1.0–1.2.0)

Description

Within bibliographic references, element sb:edited-book is used to capture the structure of book which contains contributions from several authors, edited by an editor.

Usage

One of the four type of “hosts” is sb:edited-book, used when structuring references to edited books, i.e., books that contain contributions from several authors.

The first subelement, the optional editor group (sb:editors) contains the names of the editors of the work. This is followed by the sb:title and/or the sb:translated-title.

The edited book can be the proceedings of a conference, and if conference details, such as place and date of the conference, are present these can be captured with sb:conference. In practice, bibliographic references rarely contain such detailed information.

Information about the edition can be captured with sb:edition. If the edited book is itself a member of a book series, this can be recorded using sb:book-series. The publication date(s) are tagged with sb:date.

The name and place of the publisher are contained in sb:publisher.

Finally, the element sb:isbn can be used to capture the ISBN number of the referenced book, if required.

Version history

The parameter entity %sb.titles; was introduced in CEP 1.1.0.

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
**sb:edition**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```
<!ELEMENT sb:edition ( %richstring.data; )*>
```

**Description**

**Usage**

```
```

**See also**

Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:editor

Declaration

Model (CEPs 1.1.0–1.1.6)

```
<!ELEMENT sb:editor ( %name; )>
```

Model (CEP 1.2.0)

```
<!ELEMENT sb:editor ( %name; )>
<!ATTLIST sb:editor
  orcid CDATA #IMPLIED>
```

Description

Within structured bibliographic references, editor names are tagged using `sb:editor`.

Usage

The element `sb:editor` has `%name;` as its content model, which means that it contains a `ce:surname` and an optional `ce:given-name` in any order, possibly followed by a `ce:suffix` and one or more `ce:alt-names`. For more details, see those elements.

Attribute `orcid` contains a unique identification of the author coming from a global author database: the ORCID (Open Research & Contributor ID).

Version history

In CEP 1.2.0 the attribute `orcid` was added, while element `ce:alt-name` was added to parameter entity `%name;`.

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:editors

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT sb:editors ( sb:editor+, sb:et-al? )>

Description

Within bibliographic references, the element sb:editors contains one or more editor names and possibly an “et al.” indicator. The element is referred to as editor group.

Usage

An sb:book-series, an sb:edited-book and an sb:issue can have (guest) editors. The element sb:editors is a container element for one or more sb:editors and optionally an sb:et-al.

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:e-host

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT sb:e-host ( ce:inter-ref?, sb:date? )>

Description

The element sb:e-host is used to capture references to electronic media.

Usage

If one of the hosts of a bibliographic reference is a preprint in an electronic preprint archive or another document on an electronic platform, the element sb:e-host is used. It may contain a ce:inter-ref and/or an sb:date, although it is only useful when it contains ce:inter-ref.

The hyperlink to the electronic platform is established using ce:inter-ref. For detailed information, see that element.

The date of publication can be captured with the sb:date subelement.

XML

<sb:e-host>
  <ce:inter-ref id="interref37"
      xlink:role="http://www.elsevier.com/xml/linking-roles/preprint"
      xlink:href="arxiv:/hep-th/9112009">hep-th/9112009</ce:inter-ref>
</sb:e-host>

See also

Bibliographic references are explained in more detail in the section Bibliographic references (p. 426).
sb:et-al

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT sb:et-al EMPTY>

Description

Within structured bibliographic references, occurrences of the phrase “et al.” are structured with sb:et-al.

Usage

The element sb:et-al is used when the bibliographic reference only lists part of the authors or editors.

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
**sb:first-page**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```
<!ELEMENT sb:first-page ( %richstring.data; )*>
```

**Description**

Within structured bibliographic references, the number of the first page of a publication is tagged using `sb:first-page`.

**Usage**

The element `sb:first-page` contains the first page of a bibliographic reference. If the reference has a page range, the number of the last page is to be captured using `sb:last-page`. The element may not contain an en-dash.

```
XML
<sb:first-page>121</sb:first-page>
XML
<sb:first-page>A-12</sb:first-page>
XML
<sb:first-page>37v</sb:first-page>
```

**See also**

`s`:last-page. Structured references are explained in more detail in the section Bibliographic references (p. 426).
Chapter 10 – Structured bibliographic references

sb:host

Declaration

Model (CEPs 1.1.0–1.1.6)

```xml
<!ELEMENT sb:host ( ( ( sb:issue, sb:pages? ) | sb:book |
```

Model (CEP 1.2.0)

```xml
<!ELEMENT sb:host ( ( ( ( sb:issue | sb:book | sb:edited-
                         book ), sb:pages? ) | sb:e-host ),
                         ce:doi? )>
```

Description

Within bibliographic references, the structure of a host is captured using `sb:host`.

Usage

A bibliographic reference is structurally split into a “contribution” and one or more “hosts”. The host is the physical appearance that “contains” the reference. There can be more than one host: a version of an article on the author’s homepage, a version in a journal issue, a version in a spin-off book, a version on ScienceDirect®.

A host can be one of four varieties: `sb:issue`, `sb:book`, `sb:edited-book` or `sb:e-host`. For more information, see these elements.

In order to locate the contribution within an issue, a book or an edited book, an optional `sb:pages` is added to the `sb:host`. Each host can have a DOI, captured using the `ce:doi` element.

Version history

Prior to DTD 5.0, the `pages` element was contained within elements `issue` and `edited-book`. Adding `sb:pages` to a `sb:book` was made possible in CEP 1.2.0.

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:isbn

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT sb:isbn ( %string.data; )*>
```

**Description**

Within structured bibliographic references, the ISBN of a book is tagged using `sb:isbn`.

**Usage**

If in structured references the ISBN of a book needs to be captured, this can be done by the element `sb:isbn`.

In practice, bibliographic references rarely contain ISBNs. The element is very useful, however, in the frontmatter of a book review.

```xml
<sb:isbn>0-13-065567-8</sb:isbn>
```

**See also**

`book-review`. Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:issn

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT sb:issn ( %string.data; )*>

Description

Within structured bibliographic references, the ISSN of a serial publication is captured using sb:issn.

Usage

Although this happens rarely in practice, an ISSN of a serial publication can be tagged with sb:issn. This element is an optional element within sb:series.

XML
<sb:issn>0167-8396</sb:issn>

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
**sb:issue**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```
<!ELEMENT sb:issue ( sb:editors?, ( %sb.titles; )?,
                    sb:conference?, sb:series, sb:issue-nr?, sb:date )>
```

**Description**

Within bibliographic references, the structure of a journal issue is captured using **sb:issue**.

**Usage**

One of the four type of “hosts” is **sb:issue**, used when structuring references to articles in journal issues or to whole journal issues. The article is the “contribution”; the journal issue is the “host”.

The first three subelements of **sb:issue** are an editor group (**sb:editors**), **sb:title** and/or **sb:translated-title**, and conference information (**sb:conference**). These are used when the bibliographic reference contains special issue information.

The titles mentioned above should not be confused with the titles appearing within the subelement **sb:series**, which contains the journal name and optionally the volume number. Each reference to an issue must have a title within **sb:series** (the journal name) but much fewer references will have a title on the **sb:issue** level.

If available, the issue identification can be captured with **sb:issue-nr**.

The last subelement, the mandatory **sb:date**, contains the publication date of the issue. (Most references only have the year.)

The page range on which the article appears is captured within the **sb:pages** element on the **sb:host** level.

**XML**

```xml
<sb:host>
  <sb:issue>
    <sb:series>
      <sb:volume-nr>193</sb:volume-nr>
    </sb:series>
    <sb:issue-nr>1-2</sb:issue-nr>
    <sb:date>1998</sb:date>
  </sb:issue>
  <sb:pages>
    <sb:first-page>97</sb:first-page>
    <sb:last-page>112</sb:last-page>
  </sb:pages>
</sb:host>
```
See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:issue-nr

Declaration

Model (CEPs 1.1.0–1.2.0)

```xml
<!ELEMENT sb:issue-nr ( %richstring.data; )*>
```

Description

Within structured bibliographic references, issue numbers are tagged using `sb:issue-nr`.

Usage

The element `sb:issue-nr` may contain an issue number or a range of issue numbers.

```xml
<sb:issue-nr>2–4</sb:issue-nr>
<sb:issue-nr>Suppl. 1</sb:issue-nr>
```

sb:last-page

Declaration

Model (CEPs 1.1.0–1.2.0)
<!ELEMENT sb:last-page ( %richstring.data; )*>

Description

Within structured bibliographic references, the last page of a page range can be captured using\textit{sb:last-page}.

Usage

The number of the last page of a bibliographic reference is contained in \textit{sb:last-page}. It should always be greater than \textit{sb:first-page}.

Copy edit considerations

The number of the last page should always be given in full. That is, if a page range 147–9 is given, \textit{sb:last-page} should contain 149. Similarly, in case of page range S155–161, \textit{sb:last-page} should contain S161.

See also

\textit{sb:first-page}. Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:location

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT sb:location ( %richstring.data; )*>

Description

Within structured bibliographic references, the location of a publisher can be captured using the element sb:location.

Usage

See sb:publisher.

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:maintitle

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT sb:maintitle ( %text.data; )*>

Description

The main title of a structured bibliographic reference is captured using sb:maintitle.

Usage

See sb:title.

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:name

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT sb:name ( %richstring.data; )*>

Description

Within structured bibliographic references, the name of the publisher is captured using sb:name.

Usage

See sb:publisher.

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:pages

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT sb:pages ( sb:first-page, sb:last-page? )>

Description

Within structured bibliographic references, pages or page ranges of a publication are contained in sb:pages.

Usage

The element sb:pages contains a mandatory sb:first-page and an optional sb:last-page.

XML

<sb:pages>
  <sb:first-page>37</sb:first-page>
  <sb:last-page>51</sb:last-page>
</sb:pages>

Presentation

37–51

Some layout styles abbreviate 121–127 to 121–7. This should be solved by the style sheet: the last page is always captured as “127”.

Version history

The element has been moved to the sb:host level and out of the sb:issue and sb:edited-book level.

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:publisher

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT sb:publisher ( sb:name, sb:location? )>

Description

Within structured bibliographic references, the name and place of the publisher of the publication are captured using sb:publisher.

Usage

The element sb:publisher contains a mandatory sb:name, the name of the publisher or the imprint, and an optional sb:location, the place or places where the publisher is located.

XML

<sb:publisher>
  <sb:name>North-Holland</sb:name>
  <sb:location>Amsterdam</sb:location>
</sb:publisher>

XML

<sb:publisher>
  <sb:name>American Mathematical Society</sb:name>
  <sb:location>Providence, RI</sb:location>
</sb:publisher>

XML

<sb:publisher>
  <sb:name>Springer-Verlag</sb:name>
  <sb:location>Heidelberg, Berlin</sb:location>
</sb:publisher>

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
**sb:reference**

**Declaration**

Model (CEPs 1.1.0–1.2.0)

```xml
<!ATTLIST sb:reference
  id ID #IMPLIED
  xmlns:sb CDATA #FIXED %ESSB.xmlns;>
```

**Description**

The element *sb:reference* is used to capture a fully structured reference.

**Usage**

A structured reference is contained in an *sb:reference* element. Each *sb:reference* consists of an optional *sb:contribution* and one or more *sb:host*s. Comments can be inserted between these elements using *sb:comment*.

An *sb:reference* may have a *ce:label* subelement and an *id* attribute. These are used if the *sb:reference* is part of a multiple reference.

**Version history**

Prior to DTD 5.0, this element was called bb.

**See also**

*sb:comment*, *sb:contribution* and *sb:host*. Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:series

Declaration

Model (CEPs 1.1.0–1.1.6)

<!ELEMENT sb:series ( ( %sb.titles; ), sb:issn?, sb:volume-nr? )>

Model (CEP 1.2.0)

<!ELEMENT sb:series ( ( %sb.titles; )?, sb:issn?, sb:volume-nr? )>

Description

Within structured bibliographic references, the element sb:series is used to identify serial publications.

Usage

The element sb:series is used to capture the journal title and the volume number of an issue appearing in that journal, or the title of a book series and the volume number of a book that appears in a book series. It can also contain the ISSN of the serial publication. Although all subelements are optional, at least one should be present.

Version history

The parameter entity %sb.titles; was introduced in CEP 1.1.0. It was made optional in CEP 1.2.0.

See also

sb:book-series and sb:issue. Structured references are explained in more detail in the section Bibliographic references (p. 426).
**sb:subtitle**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT sb:subtitle (%text.data;)>```

**Description**

The subtitle of a structured bibliographic reference is captured using `sb:subtitle`.

**Usage**

See `sb:title`.

**See also**

Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:title

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT sb:title (sb:maintitle, sb:subtitle?)>

Description

Within bibliographic references, titles are tagged using sb:title. Depending on the context, this can be the title of an article or a book, the name of a journal or a book series, etc.

Usage

An sb:title consists of sb:maintitle and optionally sb:subtitle. Please refer to ce:subtitle for a description of what constitutes a subtitle.

XML

<sb:title>
  <sb:maintitle>The SGML Implementation Guide</sb:maintitle>
  <sb:subtitle>A Blueprint for SGML Migration</sb:subtitle>
</sb:title>

See also

Structured references are explained in more detail in the section Bibliographic references (p. 426).
sb:translated-title

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT sb:translated-title ( sb:maintitle, sb:subtitle? )>

Description

Within bibliographic references, translated titles are tagged using sb:translated-title.

Usage

Often, when a contribution is written in a different language, the author has translated the title for the benefit of the reader. A comment “(in Dutch)” or similar is then added to the reference. To this end, sb:book, sb:contribution, sb:edited-book, sb:issue and sb:series can have an sb:translated-title.

The element sb:translated-title consists of a sb:maintitle as well as an optional sb:subtitle. See sb:title for more information.

XML

```xml
<sb:contribution>
  <sb:authors>
    <sb:author>
      <sb:given-name>E.M.H.</sb:given-name>
      <sb:surname>Assink</sb:surname>
    </sb:author>
    <sb:author>
      <sb:given-name>N.</sb:given-name>
      <sb:surname>Verloop</sb:surname>
    </sb:author>
  </sb:authors>
  <sb:title>
    <sb:maintitle>Het aanleren van deel&#x02013;geheel relaties</sb:maintitle>
    <sb:translated-title>
      <sb:maintitle>Teaching part&#x02013;whole relations</sb:maintitle>
    </sb:translated-title>
  </sb:title>
</sb:contribution>
```

Structured references are explained in more detail in the section Bibliographic references (p. 426).
The Elsevier DTD 5.0 family uses MathML for its mathematical formulae. The element `mml:math` can be used inline and as subelement of `ce:formula`.

We refer to specialized MathML documentation for more information about MathML tagging.

MathML exists in two forms known as Presentational MathML and Content MathML. Content MathML captures the meaning of the formula; the presentation of the formula is a derivative thereof. Presentational MathML merely captures the presentation of the formula; math notation is such that the meaning can be derived from the presentation to some extent, but never fully so.

It is expected that Content MathML cannot be written or keyed in by humans; it will always be generated by mathematical software. Certainly in the beginning, we do not expect to receive much material in Content MathML from authors. Conversions from mathematical typesetting formats such as TeX will produce Presentation MathML. Therefore our articles will almost always contain Presentational MathML when they follow the regular workflow.

We do not exclude Content MathML. Applications downstream should in principle be prepared to receive and process both types of MathML.

The CEP 1.2 includes a version of MathML modified by Elsevier. Standard, the `mml:mtext` element can only contain `#PCDATA`, which is insufficient. Therefore we made sure that the content allows `%nondisplay.data`; to be used. For instance, this allows us to make cross-references within a displayed formula.

MathML Plane One characters may not be used, `mathvariant` should be used instead.
Usage of MathML elements and attributes

For backwards compatibility, version 2 of the MathML standard [24] contains a number of deprecated attributes, which were present in MathML version 1. These attributes must not be used in Elsevier articles and books. They are listed in the following pages. There is one exception: The font* attributes may be used in exceptional cases, see the subsection on 'Style, fonts and mathvariants'.

The MathML standard covers many publication contexts, from articles in scientific journals to distant learning courses on the web. Consequently, some elements and attributes are more applicable to one publication context than to another. In the following pages we list the elements and attributes which are currently considered not to be applicable in the context of Elsevier articles and books. Such elements and attributes may not be used. It should be noted that understanding of this issue may evolve with time. For example, we do not see a role for the mml:maction element in current publications. With increasing understanding of the possibilities of MathML by both authors and web publishing platforms, suitable forms of usage of the mml:maction element may be identified in the years to come.

The following listing indicates which attributes are deprecated in MathML 2, and which elements and attributes may not be used in the context of Elsevier articles and books.

**Style, fonts and mathvariants**

The MathML spec. [24] allows the CSS attribute style on all elements. In addition it allows the attributes fontfamily, fontweight, fontstyle and mathvariant on all token elements. Each of these attributes can be used to specify a different style for a variable. But these attributes convey different information about the variable, and therefore they cannot be used interchangeably.

The CSS (Cascading Style Sheet) attribute style indicates a style that is imposed by features that are external to the formula, and which has no influence on the interpretation of the formula. An example is the boldening of an inline formula in a bold header. Because such presentational markup may not be used in our articles, the attribute style must not be used.

It is a characteristic of mathematical notation that a style change for a single variable indicates a different meaning of the variable: a boldface $A$ is a different variable than $A$. Such a style change may be achieved by the attribute mathvariant. The list of values of mathvariant is constrained, and the symbol in the desired style must exist as a mathematical styled character in Unicode, usually in Plane One.

If a symbol is desired in a style that is not an allowed value of the mathvariant attribute, or if a symbol in a desired style does not exist as a mathematical styled character in Unicode, it can currently not be used in that style. For example, it is not possible to have italic double-struck (open-face) characters, because italic double-struck is not an allowed value of the mathvariant attribute, and also because italic double-struck characters do not exist mathematical styled characters in Unicode.

In the future we may allow the possibility to mark a symbol up using the attributes fontfamily, fontweight and fontstyle. The value of the attribute fontfamily should be one of a list of recognized font families. Currently there are no recognized font families,
and therefore this feature is not available. We will add fonts to the list when they are re-
quired in publications. The main candidates seem to be open-face (double-struck) fonts,
for which DTD 4.x allowed more styles than MathML. It should be noted, however, that
such symbols may not easily be rendered on each reader’s computer; therefore this feature
should be used only in exceptional cases.

The MathML spec. [24, section 3.2.2.1] excludes the combined usage of the font* at-
tributes and the mathvariant attribute.

It is not allowed to use the font changing elements from the CEP to mark up a variable in
MathML, not even in the mml:mtext element. Of course, font changing elements from the
CEP are allowed to mark up an in-line formula that is tagged without MathML.

All elements

The attribute other is deprecated, and must not be used. The attributes xlink:href,
xlink:type, style must not be used.

Token elements

The attributes color and fontsize are deprecated, and must not be used. The attributes
mathsize, mathcolor, and mathbackground must not be used.

The attributes fontfamily, fontweight and fontstyle should only be used in exceptional
cases, see the subsection on ‘Style, fonts and mathvariants’.

Individual elements

mml:math

The attribute mode is deprecated and must not be used. The attributes macros, overflow,
alttext and xsi:schemaLocation must not be used.

The attributes type, name, height, width and baseline must not be used.

mml:mo

The true values of the attributes fence, separator, accent and largeop are mutually
exclusive.

When the attribute fence has the value true, the form attribute may only have the values
prefix or postfix.

When the attribute accent has the value true, the form attribute may only have the value
postfix.

When the attribute largeop has the value true, the form attribute may only have the value
prefix.

The attributes symmetric, maxsize and minsize only make sense when the attribute
stretchy has the value true.

mml:mglyph

The element mml:mglyph should only be used in exceptional cases. The value of the at-
tribute fontfamily must be taken from a list of allowed values; currently that list is empty.

mml:mstyle

The mml:mstyle element is used to make style changes that affect the rendering of its
contents. mml:mstyle can be given any attribute accepted by any MathML presentation
element provided that the attribute value is inherited, computed or has a default value (MathML spec. [24, section 3.3.4.1]). For such attributes the rules apply that are mentioned with the individual elements.

In addition, there are a number of attributes which may only be specified on the `mml:mstyle` element: background, scriptsizemultiplier, scriptminsize, veryverythinmathspace, verythinmathspace, thinmathspace, mediummathspace, thickmathspace, verythickmathspace, veryverythickmathspace. None of these attributes is allowed to be used.

`mml:mtext`

The attributes `mathvariant`, `fontweight`, `fontstyle`, `fontfamily` must not be used. Instead, the element `mml:mtext` has been modified to allow CEP inline markup.

`mml:merror`

The `mml:merror` element must not be used.

`mml:maction`

The `mml:maction` element must not be used.
mml:math

  altimg CDATA #IMPLIED
  alttext CDATA #IMPLIED>
```

Description

The element **mml:math** contains a MathML formula.

Usage

The **mml:math** element, which can be used inline and within **ce:formula**, is used to capture mathematical formulae. It is an element belonging to MathML, and we refer to MathML documentation for details. It is well-known that parsing MathML is not sufficient for a file to conform to the MathML specifications.

**mml:math** must never be nested within **mml:math**.

Each **mml:math** is delivered together with a graphical representation for rendering applications that cannot handle MathML. Such an image is called a *strip-in*. The attribute **altimg** contains the name of the strip-in image, it is a file name inclusive extension, see the section on strip-in images (p. 31).

The attribute **mode** is deprecated, and should not be used. The attributes **style**, **macros**, **overflow**, and **alttext** should not be used.

c:enunciation,c:formula,c:italic
Over the course of the years contractors of the US Department of Defense converged to a single table model, the so-called CALS Table Model (Computer-Aided Logistics Support). It became a *de facto* standard, which was used by many and supported by many software packages. OASIS published documentation of the full CALS table elements and attributes [13], in order to promote a shared interpretation. It has also critically reviewed the CALS table model and the software support for it. The result is the OASIS Exchange Model [15].

In the DTD 5.0 family, Elsevier has adopted CALS tables according to this OASIS Exchange Model. The parametrization was exploited to make %cell.data; the content of a table cell and to furnish the tables with a label, a caption, a legend and table footnotes. However, as became apparent, even with the extensive parametrization options, the CALS table model was not sufficient for our needs. This is why we extended the CALS tables with the border elements from earlier Elsevier DTDs and with a modified element for column specifications. These additional elements are placed in their own namespace, http://www.elsevier.com/xml/common/table/dtd, which can be recognized by the tb: prefix.

A CALS table is not necessarily valid if it satisfies the DTD. The description of *entry* in the CALS specification [15] summarizes conditions which make a CALS table invalid. These error conditions translate into the following requirements:

- A column name used in a colname, namest or nameend attribute must be a colname declared in a colspec or a tb:colspec in the containing tgroup.
- The names declared in different colspecs and tb:colspecs of a tgroup must be different.
- It is an error if portions of different entries overlap each other.
- It is an error if an entry’s morerows attribute specifies more additional rows than the number of remaining rows defined for the containing thead or tbody.
- It is an error if the number of columns filled by the entries in a row, taking column spanning by entries in that row, and row spanning by entries in previous rows into account, exceeds the value of the cols attribute of the containing tgroup.
- The column specified by the nameend attribute of an entry must be to the right of (i.e. have a higher column number than) the column specified by the namest attribute of the entry.

Note. The morerows attribute denotes the number of *additional rows* spanned. In this respect it differs from the attribute rspan of DTD 4 and the attribute rowspan of HTML: morerows = rspan − 1.

Note. *entry* elements which span more rows require special attention. They fill columns in their own row and in one or more following rows. The following rows have no *entry*
elements for those columns. It is not necessary nor allowed to place empty entry elements in those rows as placeholders.

The CALS table specification allows some fairly complicated constructions using column names. Elsevier wants to avoid such complications. Elsevier wants to ensure that its CALS tables have a regular and straightforward structure, and are easily transformed into display formats. This can be summarized in the following requirements. These requirements are additional to the standard CALS requirements listed above.

- An entry may not have both a namest attribute and a colname attribute.
- If an entry has a nameend attribute, it must also have a namest attribute.
- The colspecs and tb:colspecs must be listed in column order.
- There must be a colspec or tb:colspec for every column, up to the number of columns declared in the cols attribute of the containing tgroup.
- If there is a colspec or tb:colspec for a column whose number is higher than the number of columns declared in the cols attribute of the containing tgroup.
- The column names declared in the colspec or tb:colspec elements must adhere to the pattern: “col” followed by the column number, i.e. “colN”.
- The entries in a row must be listed in column order, taking into account that entries which are straddled by row spanning entries in previous rows, should be skipped.
- All entries in a row must be listed, taking into account that entries which are straddled by row spanning entries in previous rows, should be skipped.

The latter two rules are almost identical to the requirements for cells in DTD 4. The difference is that no entries are listed which are spanned by other entries.

This chapter contains a listing of the elements of the extended CALS table model. We first give a number of examples of CALS tables. After a brief overview of the native CALS elements (for more information, we refer to [1] and [15]) we list the CALS table extensions.

A table containing at least one element from the tb namespace is called an extended CALS table. Tables without these extensions are called native CALS tables.

It is only allowed to create an extended CALS table if a native CALS table cannot be used to represent the table. The examples in the next section show and explain the cases when this is appropriate. In the following cases an extended CALS table is inevitable:

- when the alignment in cells requires vertical alignmarks, tb:alignmark;
- when the border style is an “ornament” (see the ornament tables, p. 505), other than a single vertical or horizontal line;
- when the cell borders at the outer extremities of the table require a different border style than the table frame (the frame cannot be overruled);
- when cells need a top border but the cell above spans different columns;
- when cells need a left border but the cell to the left spans different rows.

**Bridge lines**

Spanning lines or bridge lines spanning a number of columns in the head of a table are created by setting the rowsep of the cell above the spanned columns. We define that the rowseps of different cells within the interior of the head never touch. This is similar to the definition in DTD 4.x.
**Inheritance of attribute values**

The CALS table model does not use default attribute values in the strict sense, that is, default values that are specified in the DTD, and that are reported by a parser. Instead, it uses the absence of an attribute value to signal that the value should be inherited from a specified other element, usually the parent element, or that it has a default value. The CALS specification mentions the possibility to specify default values in style sheets. That possibility is not used in Elsevier’s XML files; the default values are those listed in the CALS specification.

The inheritance paths and default values are as follows:

<table>
<thead>
<tr>
<th>attribute</th>
<th>inheritance path</th>
<th>default</th>
</tr>
</thead>
<tbody>
<tr>
<td>valign</td>
<td>entry → row → {thead, tbody}</td>
<td>bottom</td>
</tr>
<tr>
<td>align</td>
<td>entry → colspec → tbody</td>
<td>top</td>
</tr>
<tr>
<td>char</td>
<td>entry → colspec → tbody</td>
<td>left</td>
</tr>
<tr>
<td>charoff</td>
<td>entry → colspec → tbody</td>
<td>–</td>
</tr>
<tr>
<td>rowsep</td>
<td>entry → row → colspec → tbody → tgroup → ce:table</td>
<td>1</td>
</tr>
<tr>
<td>colsep</td>
<td>entry → colspec → tbody → tgroup → ce:table</td>
<td>1</td>
</tr>
</tbody>
</table>

In this scheme, each → means: if the attribute value is not specified for the element on the left, use the value from the element on the right. Each occurrence of colspec should be read as colspec or tb:colspec.
### Example 1

The following table is a standard CALS table except for column 6. Column 6 uses an `alignmark`, which is not available in standard CALS. The fact that this column uses an extension to the standard CALS table model is signalled by the presence of the `tb:` prefix on the `tb:colspec` and `tb:alignmark` elements.

**XML**

```xml
<ce:table id="tbl001" frame="topbot" colsep="0" rowsep="0">
  <ce:label>Table 1</ce:label>
  <ce:caption>
    <ce:simple-para>Sm-Nd data.</ce:simple-para>
  </ce:caption>
  <tgroup cols="6">
    <colspec colname="col1"/>
    <colspec colname="col2"/>
    <colspec colname="col3"/>
    <colspec colname="col4"/>
    <colspec colname="col5"/>
    <tb:colspec colname="col6"/>
    <thead>
      <row valign="top" rowsep="1">
        <entry namest="col1" nameend="col2">Eclogites</entry>
        <entry>Sm</entry>
        <entry>Nd</entry>
        <entry><ce:sup loc="pre">147</ce:sup>Sm [ce:sup loc="pre">144</ce:sup>Nd</entry>
        <entry>Yield (%)</entry>
      </row>
    </thead>
    <tbody>
      <row valign="top">
        <entry>162a</entry>
        <entry>Grenat</entry>
        <entry align="char" char=".">0.92</entry>
        <entry align="char" char=".">2.31</entry>
        <entry align="char" char="+">0.164 + 0.005</entry>
        <entry>10.51 <tb:alignmark/>+ 10.00 <tb:alignmark/>− 0.50</entry>
      </row>
      <row valign="top">
        <entry>Omphacite</entry>
        <entry align="char" char=".">6.41</entry>
        <entry align="char" char=".">23.60</entry>
        <entry align="char" char="+">0.164 + 0.04</entry>
        <entry>10.51 <tb:alignmark/>+ 10.05 <tb:alignmark/>− 0.05</entry>
      </row>
    </tbody>
  </tgroup>
</ce:table>
```
### Presentation

<th>$^{148}\text{Nd}/^{144}\text{Nd}$</th>
</tr>
</thead>
<tbody>
<tr>
<td>162a Grenat</td>
<td>0.92</td>
<td>2.31</td>
<td>0.240 + 0.005</td>
<td>10.512 + 10.000 - 0.500</td>
</tr>
<tr>
<td>Omphacite</td>
<td>6.41</td>
<td>23.60</td>
<td>0.164 + 0.04</td>
<td>10.51 + 10.05 - 0.05</td>
</tr>
</tbody>
</table>

### Explanation

The horizontal rules at the top and bottom of the table are specified by the value `topbot` of the `frame` attribute of the `ce:table` element.

The default value of the `colsep` and `rowsep` attributes of the `ce:table` element is implied, which according to the CALS documentation means that there are row and column separators for each row and column unless specified otherwise for a certain row, column or entry. Here we specify the value 0 for these attributes, which means that in this table we have no row and column specifiers unless specified otherwise for a certain row, column or entry.

The table has a single `tgroup` element, with a `thead` containing one row and a `tbody` containing 2 rows.

The `tgroup` starts with five `colspec` elements. They have no `colnum` attribute, and thus are automatically assigned to columns 1 to 5. They do specify a name for the column, in the `colname` attribute. This name is used below to specify column spanning.

The sixth element is a `tb:colspec` element. This indicates automatically that the column uses alignment markers `tb:alignmark`, due to the default value `mark` of its `align` attribute.

In principle the `colspec` elements for columns 3 to 5 could have been omitted, because we do not make use of them, and the `tb:colspec` element for column sixth could have specified that it applies to column 6, by the value of its `colnum` attribute. However, skipping `colspec` elements is less desirable because it is not supported by all CALS table applications.

The first entry of the first row spans two columns. This is indicated by the values of the `namest` and `nameend` attributes, which are the names of the starting and ending columns.

The other entries in this row override the alignment specified for the column by having their own `align` attributes.

The rule between the table head and the table body must be specified explicitly. This is done by the value 1 of the `rowsep` attribute of the `row`.

The fifth entries in the two rows in the `tbody` demonstrate that alignment may be specified on any character: these entries align on the `+` character.

The last entries use two alignment markers `tb:alignmark` to align on the `+` and `−` signs in the entry. Note that an alignment marker may introduce space to its left (see the example in the discussion of the `tb:alignmark` element). An earlier version of this example ignored that fact and was therefore in error.

This column alignment mechanism has a superficial similarity with the alignment mechanism using alignment markers and alignment groups in MathML; see Section 3.5.5 of the
MathML specification. The latter, however, is more complicated and more powerful, due to its usage of alignment groups.

Finally note that entry has mixed content. Therefore, if one would insert a linebreak after the start tag, one would insert a space at the start of the entry’s content. Similarly for a line break before the end tag. This would be undesirable.

Example 2

The following table demonstrates our requirements for regular tables.

- For each column a colspec element is present, and the colspec elements are listed in column order.
- All entry elements of a row are listed, in column order. Only a series of empty entry elements at the end of the row has been omitted.

Rows 4 and 5 demonstrate entries which span more than one row. Entries 1–3 of row 4 extend into row 5 and fill columns 1–3 in that row as well. In row 5 there are no entries for columns 1–3; the first listed (empty) entry automatically falls in column 4.

XML

```xml
<ce:table id="tbl1" frame="all">
  <tgroup cols="5">
    <colspec colnum="1" colname="col1"/>
    <colspec colnum="2" colname="col2"/>
    <colspec colnum="3" colname="col3"/>
    <colspec colnum="4" colname="col4"/>
    <colspec colnum="5" colname="col5"/>
  </tgroup>
  <tbody>
    <row>
      <entry>A</entry>
      <entry>B</entry>
      <entry>C</entry>
      <entry>D</entry>
      <entry>E</entry>
    </row>
    <row>
      <entry/>
      <entry/>
      <entry>C</entry>
    </row>
    <row>
      <entry/>
      <entry namest="col2" nameend="col4">BCD</entry>
      <entry>E</entry>
    </row>
    <row>
      <entry namest="col1" nameend="col3" morerows="1">ABCABC</entry>
      <entry>D</entry>
    </row>
    <row>
      <!--NO ENTRY-->
      <entry/>
      <entry>E</entry>
    </row>
  </tbody>
</ce:table>
```
Example 3

The following table is a standard CALS table except for one row. The cells in this row specify a left border, a top border and a right border, which are not available in standard CALS. The fact that this row uses an extension to the standard CALS table model is signalled by the presence of the `tb` prefix on the `tb:left-border`, `tb:top-border` and `tb:right-border` elements.

**XML**

```xml
<ce:table id="tbl1" frame="topbot" colsep="0" rowsep="0">
  <ce:label>Table 1</ce:label>
  <ce:caption>
    <ce:simple-para id="sp1">Colours</ce:simple-para>
  </ce:caption>
  <ce:link locator="tbl1"/>
  <tgroup cols="3">
    <colspec colnum="1" colname="col1" colwidth="3*"/>
    <colspec colnum="2" colname="col2" colwidth="2*"/>
    <colspec colnum="3" colname="col3" colwidth="4*"/>
    <thead>
      <row rowsep="1">
        <entry>Colour 1</entry>
        <entry>Colour 2</entry>
        <entry>Colour 3</entry>
      </row>
      <row rowsep="1">
        <entry namest="col1" nameend="col3">White</entry>
      </row>
      <row rowsep="1">
        <entry colsep="1">Blue</entry>
        <entry morerows="1" colsep="1">High Green</entry>
      </row>
    </thead>
    <tbody>
      <row>
        <entry>Red</entry>
        <entry>Green</entry>
        <entry>Blue</entry>
      </row>
      <row>
        <entry name="col1">White</entry>
        <entry>Green</entry>
      </row>
    </tbody>
  </tgroup>
</ce:table>
```
The colours in this table are shown in various cell entry layouts. These layouts demonstrate the various possibilities of CALS tables and of the extensions to CALS tables.

**Presentation**

The table below is a not-to-scale rendition of the table tagged above. The thick lines denote “real” lines, the thin lines indicate cell borders without border lines. The dotted oblong represents an included image.

<table>
<thead>
<tr>
<th>Colour 1</th>
<th>Colour 2</th>
<th>Colour 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>Green</td>
<td>Blue</td>
</tr>
<tr>
<td>White</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Blue</td>
<td>High Green</td>
<td>Red</td>
</tr>
<tr>
<td>Red</td>
<td></td>
<td>Blue</td>
</tr>
</tbody>
</table>

The colour names in this table are shown in various cell entry layouts. These layouts demonstrate the various possibilities of CALS tables and of the extensions to CALS tables.

a White is obtained by applying an equal mixture of Red, Green and Blue.

**Explanation**

A table may contain a mixture of `tgroup` elements and `ce:link` elements. The `ce:link` elements stand for table groups which have been captured as an image. In this example the
table opens with a `ce:link` element. Note that the image should contain the bottom border of that part of the table if there is any.

The `colspec` elements of the `tgroup` specify the relative widths of the columns. A ‘*’ denotes the unit width. The column widths are expressed as multiples of this unit width. Since decimal values are not supported by any software, the proportional width values should be integer. The actual value of the unit width is determined at rendering time. The `colspec` elements also specify names for the columns, to be used to specify column spanning.

The entry in the second row spans three columns, which is indicated by the values of the `namest` and `nameend` attributes, which are the names of the starting and ending columns.

The next row starts with an entry with a left border. Use of the extension element `tb:left-border` is the only way to achieve that.

The same row contains an entry (“High Green”) that spans two rows and is framed. The row spanning is indicated by the value of the `morerows` attribute of the `entry` element. Its left border is specified by the value of the `colsep` attribute of the two entries to the left. Its bottom border coincides with the bottom frame of the table, and need not be specified. Its top border would have been specified by the value of the `rowsep` attribute of the entry above were it not the case that the entry above spans different columns. The border of the cell above would span the same three columns, more than the top of the “High Green” cell. Therefore the only option is to use an extended CALS element, the top-border element.

The same row ends with an entry with a right border. Here using the `rowsep` attribute would not be correct, because the `colsep` and `rowsep` attributes on the outer borders of the table are overruled by the `frame` attribute of the `ce:table`. Use of the extension element `tb:right-border` is the only valid way to specify this right border.

In the last row the second entry is omitted, because its space is occupied by the entry from the row above. The table processing software should know this and move the entry count forward by 1.

**Example 4**

*XML*

```xml
<ce:table colsep="0" rowsep="0" id="tbl3" frame="topbot">
  <ce:label>Table 3</ce:label>
  <ce:caption>
    <ce:simple-para>Efficacy of Clinical Staging</ce:simple-para>
  </ce:caption>
  <tgroup cols="5">
    <colspec colname="col1"/>
    <colspec colname="col2"/>
    <colspec colname="col3"/>
    <colspec colname="col4"/>
    <colspec colname="col5"/>
    <thead>
      <row>
        <entry morerows="1" align="center" rowsep="1">Stage</entry>
        <entry namest="col2" nameend="col3" align="center" rowsep="1">Positive Predictive Value</entry>
        <entry namest="col4" nameend="col5" align="center" rowsep="1">Sensitivity</entry>
      </row>
    </thead>
  </tgroup>
</ce:table>
```

Elsevier Documentation for the XML DTD 5 Family

## Presentation

**Table 3**

Efficacy of Clinical Staging

<table>
<thead>
<tr>
<th>Stage</th>
<th>Positive Predictive Value</th>
<th>Sensitivity</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>FDG-PET/CT (%)</td>
<td>CT (%)</td>
</tr>
<tr>
<td>I</td>
<td>58</td>
<td>62</td>
</tr>
</tbody>
</table>

### Explanation

The first row of the table head has two entries which each span two columns. Both entries have a rowsep value of 1, that is, they have a row separator at their bottom. Normally, because the entries are in adjacent columns, their row separators would join to create a rule from column 2 up to column 5.

Because Elsevier tables do use spanning lines or bridge lines and do not use row separators in the table head, we use the row separators in the interior of the table head to create bridge lines. Therefore we define that the rowseps of different cells within the interior of the head never touch.

As a consequence, the row separators of the second and third entry in the first row of the table head do not touch each other. This is similar to the definition in DTD 4.x.

The definition does not extend to the rule at the bottom of the table head. The row separators of the entry with the text ‘Stage’ and of the four entries in the second row of the table head join to form a continuous rule across the table.

The value of the `rowsep` attribute on the `row` element sets the default value of the `rowsep` attribute for the `entry` elements in the row. Setting `<row rowsep="1">` is equivalent to setting `<entry rowsep="1">` for all entries in that row. Therefore the following tagging produces the same result as the above example.

### XML

```xml
...<thead>
  <row rowsep="1">
    <entry morerows="1" align="center">Stage</entry>
  </row>
</thead>
```
<table>
<thead>
<tr>
<th></th>
<th>Positive Predictive Value</th>
<th>Sensitivity</th>

<tr>
<td>CT (%)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Chapter 12 – (Extended) CALS tables

CALS table elements

This section lists the table elements from the OASIS Exchange Table Model DTD [15]. For precise descriptions about these elements and their extensive attribute lists, we refer to the literature about the CALS tables, e.g. [1].

These elements have no namespace prefix. They belong to the CALS namespace, http://www.elsevier.com/xml/common/cals.dtd, due to the xmlns attribute of the element ce:table. The element entry is an exception: it belongs to the common element pool’s namespace.

colspec

Model

```xml
<!ELEMENT colspec EMPTY>
<!ATTLIST colspec
colnum NMTOKEN #IMPLIED
colname NMTOKEN #IMPLIED
colwidth CDATA #IMPLIED
colsep %yesorno; #IMPLIED
rowsep %yesorno; #IMPLIED
align (left|right|center|justify|char) #IMPLIED
char CDATA #IMPLIED
charoff NMTOKEN #IMPLIED>
```

The element colspec defines a column specification, in which each column can be given a name, width, alignment, and a right-hand separator. The element tb:colspec is provided as an alternative, which then results in an extended CALS table.

entry

Model

```xml
<!ELEMENT entry ( %cell.data; )>
<!ATTLIST entry
colname NMTOKEN #IMPLIED
namest NMTOKEN #IMPLIED
nameend NMTOKEN #IMPLIED
morerows NMTOKEN #IMPLIED
colsep %yesorno; #IMPLIED
rowsep %yesorno; #IMPLIED
align (left|right|center|justify|char) #IMPLIED
char CDATA #IMPLIED
charoff NMTOKEN #IMPLIED
valign (top|middle|bottom) #IMPLIED
id ID #IMPLIED
role CDATA #IMPLIED
xmlns CDATA #FIXED %ESCE.xmlns; >
```

The element entry defines a cell in the table, which may or may not span more than one row or column. The default alignment and separator below and to the right, defined in
the column specification, on the row or on the table, can be overridden. The content of
this element is %cell.data; i.e. contains elements from the common element pool, as
well as the border elements tb:bottom-border, tb:left-border, tb:right-border,
tb:top-border, and the vertical mark tb:alignmark. When these elements from the
extended table namespace are present in the cell, the table becomes an extended CALS
table.

*entry* is the only element in the namespace of the common element pool that has no prefix.

### row

**Model**

```xml
<!ELEMENT row ( entry+ )>  
<!ATTLIST row
rowsep %yesorno; #IMPLIED
valign (top|middle|bottom) #IMPLIED
id ID #IMPLIED
role CDATA #IMPLIED>
```

The element *row* defines a row in the table, consisting of table entries. It has attributes to
define the alignment and separator below the row.

### tbody

**Model**

```xml
<!ELEMENT tbody ( row+ )>  
<!ATTLIST tbody
valign (top|middle|bottom) #IMPLIED>
```

The element *tbody* contains the body of the table, i.e. the rectangular structure of rows and
columns.

### tgroup

**Model**

```xml
<!ELEMENT tgroup ( ( colspec | tb:colspec )* , thead?,
 tbody )>  
<!ATTLIST tgroup
cols NMTOKEN #REQUIRED
colsep %yesorno; #IMPLIED
rowsep %yesorno; #IMPLIED
align (left|right|center|justify|char) #IMPLIED
altimg CDATA #REQUIRED>
```

The element *tgroup* contains the structure of the table: a column specification, an optional
head and a body. Note that a table foot, while present in some CALS table models, is not
available in the OASIS Exchange Table Model DTD.

The *tgroup* has an additional *altimg* attribute. This attribute contains a reference to a
graphic file containing an image of the *tgroup*. It is present for extended CALS tables.
Such a graphic representation of the table is called a *strip-in*. See the section on strip-in images (p. 31).

**thead**

**Model**

```xml
<!ELEMENT thead ( row+ )>
<!ATTLIST thead
  valign (top|middle|bottom) #IMPLIED>
```

The element `thead` contains the header rows of the table. These rows are repeated when the table is split over several pages. Prior to DTD 5.0, header rows were defined as “stubs”.
**tb:alignmark**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT tb:alignmark EMPTY>
```

**Description**

The element `tb:alignmark` is a vertical mark. It can be used to obtain complicated alignments within table cells. However, using this element takes the table outside of the scope of CALS tables.

**Usage**

A vertical alignment mark, `tb:alignmark`, is an empty element which can occur within a table cell, `entry`. If any border elements are present within the cell, they must precede the `tb:alignmark`.

If the alignment of a column is not specified by a `tb:colspec` element, then the vertical alignment mark is forbidden in the cells of that column. Otherwise, the `i`th `tb:alignmark` of the `n`th cell in a row, must be left-aligned with the `i`th `tb:alignmark` in all `n`th cells of the rows in the same `tbody`. This rule is independent of the span of a cell, i.e., in a spanned cell it is only possible to align with alignment points in the leftmost spanned column.

In a column the numbers of `tb:alignmarks` per cell need not be equal. The rules still apply when this is the case.

**XML**

```xml
<group cols="1"
<tb:colspec/>
<tbody>
 <row>
      <entry>a<tb:alignmark/>bcd<tb:alignmark/>e</entry>
   </row>
 <row>
      <entry>pq<tb:alignmark/>r<tb:alignmark/>stu</entry>
   </row>
</tbody>
</group>
```

**Presentation**

```
a  bcede
  pqr  stu
```

**See also**

`tb:colspec`. More details are given in the examples section (p. 488).
**tb:bottom-border**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT tb:bottom-border EMPTY>
<!ATTLIST tb:bottom-border
type %hline; 'bar'
style %style; 's'>
```

**Description**

The element `tb:bottom-border`, when present in a cell, provides the cell with a bottom border.

**Usage**

`tb:bottom-border` is an empty element, which may appear within a cell entry of a table. When it is present in a cell, it provides the cell with a bottom border.

Two attributes, `type` (default: bar) and `style` (default: single, s), determine what the border will look like. See Tables 8, 10 and 11 (pp. 505–506) for the allowed combinations of values of these attributes.

Border elements must come before any other content of the entry.

**See also**

More details can be found in the examples section (p. 488).
tb:colspec

Declaration

Model (CEPs 1.1.0–1.2.0)

<!ELEMENT tb:colspec EMPTY>
<!ATTLIST tb:colspec
  colnum   NMTOKEN    #IMPLIED
  colname  NMTOKEN    #IMPLIED
  colwidth CDATA      #IMPLIED
  colsep   %yesorno;  #IMPLIED
  rowsep   %yesorno;  #IMPLIED
  align    ( mark )   #FIXED 'mark'>

Description

A tb:colspec element must be used instead of a colspec element to specify a column that uses alignment on tb:alignmark elements.

Usage

A tb:colspec element is used in the same way as a colspec element, except that its align attribute has the fixed value mark.

Version history

Prior to DTD 5.0, vertical alignment along marks was specified with the value vmk of the ca attribute of the c element.

See also

For an example see tb:alignmark. More details can be found in the examples section (p. 488).
**tb:left-border**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT tb:left-border EMPTY>
<!ATTLIST tb:left-border
type %vline; ‘vb’
style %style; ‘s’>
```

**Description**

The element `tb:left-border`, when present in a cell, provides the cell with a left border.

**Usage**

`tb:left-border` is an empty element, which may appear within a cell `entry` of a table. When it is present in a cell, it provides the cell with a left border.

Two attributes, `type` (default `vb`) and `style` (default: single, `s`), determine what the border will look like. See Tables 9, 10 and 11 (pp. 505–506) for the allowed combinations of values of these attributes.

Border elements must come before any other content of the `entry`.

**See also**

More details can be found in the examples section (p. 488).
**tb:right-border**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT tb:right-border EMPTY>
<!ATTLIST tb:right-border
type %vline; 'vb'
style %style; 's'>
```

**Description**

The element `tb:right-border`, when present in a cell, provides the cell with a right border.

**Usage**

`tb:right-border` is an empty element, which may appear within a cell entry of a table or an array. When it is present in a cell, it provides the cell with a right border.

Two attributes, `type` (default vb) and `style` (default: single, s), determine what the border will look like. See Tables 9, 10 and 11 (pp. 505–506) for the allowed combinations of values of these attributes.

Border elements must come before any other content of the `entry`.

**See also**

More details can be found in the examples section (p. 488).
**tb:top-border**

**Declaration**

**Model (CEPs 1.1.0–1.2.0)**

```xml
<!ELEMENT tb:top-border EMPTY>
<!ATTLIST tb:top-border
  type %hline; 'bar'
  style %style; 's'>
```

**Description**

The element **tb:top-border**, when present in a cell, provides the cell with a top border.

**Usage**

**tb:top-border** is an empty element, which may appear within a cell `entry` of a table or an array. When it is present in a cell, it provides the cell with a top border.

Two attributes, `type` (default: bar) and `style` (default: single, s), determine what the border will look like. See Tables 8, 10 and 11 (pp. 505–506) for the allowed combinations of values of these attributes.

Border elements must come before any other content of the entry.

**See also**

More details can be found in the examples section (p. 488).
Ornament types and styles

Several elements have `type` and `style` attributes, defining an *ornament*. The attribute values and the allowed combinations are described in this section.

Table 8: Valid values (%hline;) of the `type` attribute of elements that specify a horizontal line or other ornament. These occur in `tb:bottom-border` and `tb:top-border`.

<table>
<thead>
<tr>

All other horizontal and vertical types may only occur in combination with s, b or bl.
in
Appendix A

How to read the DTD

This appendix gives a guideline about how to read the element models in this documentation.

Element definitions

An element definition typically looks like this:

```
<!ELEMENT article ( item-info, ce:floats?,
                 head, body?, tail? )>
```

Here `article` is the element which is defined.

The second part of the definition is the declaration of the allowed content, i.e. the elements which appear within the element. It states that `article` always starts with `item-info`, and is then followed by a number of optional elements.

The quantifiers, positioned after the name of the element, are listed below. These indicate how many occurrences of the element are allowed.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>occurs precisely once</td>
</tr>
<tr>
<td>?</td>
<td>optional: 0 or 1 occurrence</td>
</tr>
<tr>
<td>*</td>
<td>0 or more occurrences</td>
</tr>
<tr>
<td>+</td>
<td>1 or more occurrences</td>
</tr>
</tbody>
</table>

The following connectives indicate how the elements may be combined.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>,</td>
<td>follows</td>
</tr>
<tr>
<td></td>
<td>or</td>
</tr>
</tbody>
</table>

Some elements are not allowed to have content. They are called empty elements and are declared as follows:

```
<!ELEMENT ce:link EMPTY>
```

Element `ce:link` can occur as follows, `<ce:link locator="gr2"></ce:link>`, although the abbreviated version is strongly preferred, `<ce:link locator="gr2"/>`.

XML parse tree

When following the element definitions, a parse tree is built up, whose root is the top element, and whose leaves are either empty elements or `#PCDATA`. 
Appendix A – How to read the DTD

Apart from the regular keyboard characters #PCDATA can contain all the Unicode characters (e.g. ñ or ö) plus all the general entities declared in the DTDs. In our DTDs, these are character entities that came with the MathML DTD (e.g. &agr;) a small alpha) and glyph entities that are declared in the file ESextra.ent. This file is “included” in the DTD by means of an XML file inclusion.

For the glyph entities see the section Elsevier’s additional glyphs (p. 27).

**Parameter entities**

Some element or attribute definitions contain a parameter entity such as %font-change;.

These act as abbreviations. Their definition can be looked up elsewhere in the DTD:

```xml
<!ENTITY % font-change "ce:bold|ce:italic|ce:monospace |ce:sans-serif|ce:small-caps">
```

The bit between quotes should be substituted for the parameter entity. Parameter entities can themselves contain parameter entities. If one for instance examines element ce:section-title and expands the entities, one can conclude that it can contain ce:inline-figure in its content.

For more information see the section Parameter entities (p. 174).

The model of element ce:figure uses all the quantifiers and connectives mentioned above as well as a parameter entity:

```xml
<!ELEMENT ce:figure ( ce:label?, ce:caption*, ce:source?,
 ( %copyright; )?,,
 ( ce:link | ce:figure )+ )>
```

This means that the content of element ce:figure consists of an optional ce:label, optional ce:captions, an optional ce:source, an optional ce:copyright and a list of (at least one) ce:link or ce:figure elements.

**Attribute definitions**

An attribute definition typically looks like this:

```xml
<!ATTLIST ce:date-received
day NMTOKEN #IMPLIED
month NMTOKEN #REQUIRED
year NMTOKEN #REQUIRED>
```

This means that the element ce:date-received possesses three attributes, day, month and year. Attribute day is optional, the other two attributes are mandatory. All three attributes are numbers.

The middle column defines the type of attribute. The following types are in existence.

<table>
<thead>
<tr>
<th>Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CDATA</td>
<td>ASCII text</td>
</tr>
<tr>
<td>ENTITY</td>
<td>external entity declared at start of document</td>
</tr>
<tr>
<td>ENTITIES</td>
<td>one or more ENTITYs</td>
</tr>
<tr>
<td>ID</td>
<td>XML ID, string of digits, letters, ..-, starts with a letter</td>
</tr>
<tr>
<td>IDREF</td>
<td>ID declared elsewhere in the document</td>
</tr>
<tr>
<td>IDREFS</td>
<td>one or more IDREFs</td>
</tr>
<tr>
<td>NMTOKEN</td>
<td>string of digits, letters, . and –</td>
</tr>
<tr>
<td>NMTOKENS</td>
<td>one or more NMTOKENs</td>
</tr>
<tr>
<td></td>
<td>list of values only one of these values is allowed</td>
</tr>
</tbody>
</table>
Type ENTITIES is not used in our DTDs, while types IDREFS and NMTOKENS are only used in our 4.x DTDs.

Here is an example of a list of values. Note that the parameter entity %e-address-type; was expanded.

```xml
<!ELEMENT ce:e-address ( %text.data; )* >
<!ATTLIST ce:e-address
type (email|url) "email">
```

The right-hand column can contain the following.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>#IMPLIED</td>
<td>attribute is optional</td>
</tr>
<tr>
<td>#REQUIRED</td>
<td>attribute is mandatory</td>
</tr>
<tr>
<td>value</td>
<td>if omitted, this is the default value</td>
</tr>
<tr>
<td>#FIXED</td>
<td>the only possible value</td>
</tr>
</tbody>
</table>

**XPath**

XPath is a language for addressing parts of an XML document. Here are three examples of the use of XPath that have started to appear in communications.

The title of a ce:glossary:

`ce:glossary/ce:section-title`

The title of a ce:glossary in a book glossary:

`glossary/ce:glossary/ce:section-title`

Attribute role of element ce:section:

`ce:section/@role`
